HEALTH DEPARTMENT STAFF AS AT 1st AUGUST, 1967

Medical Officer of Health and Port Medical Officer:—
J. McA. Taggart, M.B., B.Ch., D.P.H., D.P.A., F.R.S.H.

Deputy Medical Officer of Health and Deputy Port Medical Officer:— W. J. McLeod, M.D., D.P.H., D.P.A., Ph.C.

HEADQUARTERS:—

Administrative Officer:— S. N. Smith, B.Com.Sc.

Administrative Branch:—

3 Receptionist/Operators.

Accounts Branch:

1 Executive Assistant; 1 Clerical Officer; 3 Clerical Assistants.

Stores Branch:-

1 Clerk Higher Division Grade I; 1 Clerical Officer; 2 Clerical Assistants; 1 Storekeeper; 2 Storemen.

Registration Branch:

Superintendent Registrar of Births, Deaths and Marriages — T. S. McMonagle.

1 Deputy Supt. Registrar; 4 Registrars; 3 Deputy Registrars; 2 Typists.

Typing Branch:—

1 Supervisor of Typists; 5 Shorthand Typists; 2 Typists.

ENVIRONMENTAL HEALTH DIVISION:-

Senior Medical Officer—vacant.

Executive Officer—G. H. Davis, E.R.D.

Infectious Diseases Branch:

Medical Officer—J. A. Gilmore, M.B., D.P.H.

1 Clerk Higher Division Grade II; 8 Clerical Assistants.

Sanitary Branch:—

Chief Public Health Inspector —W. Jenkins. Senior Food Inspector —R. J. Coulter Senior Pests and Disinfecting Officer —W. Robinson Senior Inspector of Factories and Shops -P. J. McMahon Senior Smoke Officer —C. Ellison. Senior Port Public Health Inspector —W. A. McBride Senior Housing Inspector —A. Bunting Divisional Public Health Inspector, South —W. N. Shields Divisional Public Health Inspector, West —F. W. Hill Divisional Public Health Inspector, East -T. F. Mills Divisional Public Health Inspector, North — J. Thompson

- 7 Food and Drugs Inspectors; 2 Port Public Health Inspectors; 3 Factory and Shops Inspectors; 1 Smoke Inspector; 3 Housing Inspectors; 18 Public Health Inspectors; 6 Pests Officers; 12 Pupil Public Health Inspectors.
- 1 Clerk Higher Division Grade I; 2 Clerks Higher Division Grade II; 1 Clerk Higher Division Grade III; 4 Clerical Officers; 8 Clerical Assistants; 1 Notice Server; 4 Drivers; 1 Attendant (Disinfecting Station); 1 Labourer.

Meat Inspection Branch:—

City Veterinarian—J. F. Gracey, Ph.D., B.Agr., M.R.C.V.S., D.V.S.M.

Asst. City Veterinarian—W. T. Morrow, B.V.M.S., M.R.C.V.S.

Senior Meat Inspector—S. J. C. Boyd.

6 Meat Inspectors; 1 Typist.

MATERNITY AND CHILD HEALTH DIVISION:-

Senior Medical Officer — H. A. Warnock, M.D., B.Sc., D.P.H.

Clinic Medical Officer — K. M. Cathcart, M.B., D.P.H.

12 Part-time Medical Officers

Superintendent Nursing Officer —Miss M. F. J. Baird, M.B.E., S.R.N., S.C.M., H.V.Cert.

Deputy Superintendent Nursing

Officer — Miss J. Stirling, S.R.N., S.C.M., H.V.Cert.

Superintendent of District Nurses — Miss H. A. Harris, S.R.N., S.C.M., H.V.Cert., Q.N.

Supervisor of Midwives — Mrs. M. A. Whinnery, S.R.N., R.S.C.N., S.C.M.

Area Superintendent Health

Visitors

— Miss K Smyth, S R.N., S.C.M., H.V.Cert., T.A.Cert.

— Miss D. E. McFarland, S.R.N., S.C.M., H.V.Cert.

First Assistant Superintendent of District Nurses:— Miss M. L. Lester, S.R.N., S.C.M., H.V. Cert., Q.N.

53 Health Visitors; 6 Trainee Health Visitors; 51 District Nurses; 1 Staff Nurse; 4 Enrolled Nurses; 2 Senior Midwives; 23 Midwives (salaried); 3 Midwives, (fee-per-case).

Chiropodists: 4 full-time, 6 part-time.

Administrative Assistant — A. Watson, A C.I.S.

I Higher Division Clerk, Grade II; 1 Higher Division Clerk Grade III; 2 Clerical Officers; 2 Shorthand Typists; 1 Typist; 13 Clerical Assistants; 10 Clinic Clerks (part-time);

3 Cook-Housekeepers; 4 Clinic Caretakers

SCHOOL HEALTH DIVISION:-

Senior Medical Officer — A. L. Walby, M.B., D.P.H.

Clinic Medical Officers:— A. D. Campbell, M.B., D.P.H.

E. A. M. McMordie, M.B., D.P.H.

P. S. Kerr, M.B., D.P.H.

K. McKee, M.D., D.P.H., D.C.H.

Medical Officers: — E. E. Mercer, M.B., D.P.H.

D. B. Keith, M.B., D.P.H. G. K. Moffatt, M.B., D.P.H.

K. M. Corbett, M.D., B.Sc., D.P.H., D.C.H.

S. G. Gordon, M.B., B.S., M.R.C.S., L.R.C.P., D.P.H., D.C.H.,

D.T.M.H.

F. L. O'Rourke, M.B., D.P.H. D. C. Oswald, M.B., D.P.H. R. M. Meyers, M.B., B.A.O. 1 Part-time Medical Officer

Chief Dental Officer: — S. R. Sheane, L.D.S.

Clinic Dental Officers: — V. M. G. Rattie, L.D.S.

H. C. Thornberry, L.D.S. P. J. R. Griffith, M.B., L.D.S.

J. R. Faulkner, L.D.S.

Dental Officers: — T. S. Brannigan, L.D.S.

W. J. Hutchinson, L.D.S.

J. S. Jassal, L.D.S.

W. J. C. Davidson, L.D.S. Mrs. D. Bolton, L.D.S. J. A. Gow, L.D.S.

C. A. Fetherston, L.D.S.

3 Part-time Medical Officers (Anaesthetists); 2 Part-time Dental Officers.

4 Senior School Nurses; 18 Health Visitors; 9 Trainee Health Visitors; 6 Clinic Nurses; 1 Speech Therapist; 5 Speech Therapists (part-time); 2 Physiotherapists; 1 Chief Dental Clerk; 3 Senior Dental Surgery Assistants; 27 Dental Surgery Assistants.

Executive Officer — W. W. Magowan.

1 Clerk Higher Division Grade II; 2 Clerical Officers; 4 Shorthand Typists; 5 Typists; 1 Senior Clerical Assistant; 9 Clerical Assistants; 2 Clinic Caretakers; 1 Clinic Attendant.

CITY AND COUNTY BOROUGH OF BELFAST

SUMMARY OF STATISTICS, 1966

LATITUDE 54° 35" N.: LONGITUDE 5° 55" W.

AREA (Census 1961: excluding 2,237 acres tidal water): 15,815 acres (24.7 sq. miles)

POPULATION (Estimate of Registrar-General, 30th June, 1966: (Census, October, 1966 — 399,270) (Females 213,200)

POPULATION per acre: 25; per square mile: 16,310.

INHABITED BUILDINGS (Census 1966): 116,101.

RATEABLE VALUATION (1966/67): £5,250,285.

PRODUCT OF A PENNY RATE (1966/67): £20,820.

MARRIAGES: 3,569; MARRIAGE RATE RATE: 8.9

	1966	1965	Average 1956/65

To:

The Right Honourable The Lord Mayor, Aldermen and Councillors of the Belfast County Borough Council acting as the Belfast Health Authority and the Belfast Port Sanitary Authority.

My Lord Mayor, Ladies and Gentlemen,

I have pleasure in presenting my report on the work of the Health Department and the health of the City for the year 1966.

Population:

The Registrar General estimates the population in June 1966 as 402,900 (males 189,700; females 213,200), a reduction of 3,900 compared with 1965. The population figure at the October, 1966, census was 399,270.

Births and Deaths:

There was a reduction in the number of live births registered, 8,316, (males 4,296; females 4,020) giving a birth rate of 20.6 as compared with 8,447 (birth rate 20.8) in 1965. Infant mortality showed a slight increase, there being 264 deaths of infants in the first year of life, compared with 232 in 1965. This represents a rate of 32 per 1,000 live births. Both neo-natal death rate (deaths during the first month of life) and peri-natal death rate (stillbirths and deaths during first week of life) showed slight increases, the figures being 19 and 34 respectively as against 18 and 33 in 1965.

The percentage of total registered births taking place in institutions was 87.6 as against 83.2 for 1965. This is in keeping with the trend in recent years for mothers, who prefer to have their babies in hospital rather than in their own homes. There will be a shortage of maternity beds in hospitals and maternity units for some years to come but this will be off-set by mothers being discharged from hospital much earlier than hitherto. Where the confinement has been normal and home conditions are suitable, many mothers will in future be discharged as early as 48 hours after their babies are born.

The number of deaths at all ages registered during the year was 5,083, (males 2,575; females 2,508) showing an increase on 1965 when the number registered was 4,745. The 1966 death rate was 12.6 per 1,000 of the population.

For the first time on record, no deaths from maternal causes occurred during the year.

Cancer:

Deaths from all forms of cancer numbered 844 as against 810 in 1965, there being 15 more deaths from cancer of the lung and respiratory system than in the previous year. Although there are promising signs of a decrease in the number of cigarette smokers in the population and clear evidence of decreased lung cancer mortality among doctors, many of whom have stopped smoking or have altered their smoking habits, the public have not accepted the clear evidence of the positive association between cigarette smoking and lung cancer. Much more intensive and prolonged health education of children of school age is clearly required.

Tuberculosis:

Deaths from all forms of tuberculosis, 24, showed a decrease of 6 from the figure for 1965, representing a death rate of 0.05 per 1,000 population. Following the rise in the number of new cases of pulmonary tuberculosis notified in 1965, there has been an encouraging drop in incidence in 1966, 146 new cases being notified, or 28 fewer than in the previous year.

Infectious Disease:

With the exception of gastro-enteritis, which showed an increase during the year, the incidence of infectious disease was again well below the average of recent years. One case of poliomyelitis was notified but this did not prove to be a case of recent origin and laboratory confirmation of the diagnosis was not possible. The usual procedure of immunisation of contacts (close and remote) was however adopted. An added duty which has fallen to our Medical Officers is the surveillance of Commonwealth

immigrants and other foreign nationals who come to our shores for a variety of reasons, some to work in the catering and allied trades, others to study for higher qualifications or take up lectureship appointments in Northern Ireland.

Prevention of Cancer:

Owing to the shortage of qualified laboratory technicians it has not been possible to expand the cervical cytology service as had been hoped. Nevertheless four cytology sessions were arranged weekly at three centres throughout the year. At these centres women have an opportunity of discussing all aspects of cancer prevention with women doctors and health visitors. In addition to taking the cervical smear for the early detection of cancer of the neck of the womb, further examinations are carried out to detect other abnormalities. Women are also instructed in the technique of self-examination of the breasts with a view to detecting cancer of the breast in its earliest stages. This is the most common form of cancer in women, being responsible for 66 deaths in 1966. Patients with abnormalities detected at cancer prevention clinics are referred to their family doctors for further investigation and appropriate treatment.

Care of the Elderly:

Care of the elderly in the community will continue to impose an ever-increasing burden on the various services provided by the Health Department. These involve mainly the home nursing, health visiting and chiropody services. The chiropody service, mainly owing to the national shortage of qualified chiropodists, is finding increasing difficulty in giving elderly patients prompt and frequent treatment. At the end of the year 81 sessions were being held weekly, 4 full-time and 5 part-time chiropodists being employed. During the year 7,467 persons received treatment; 19,087 treatments were carried out – 14,806 at clinics and 4,281 in patients' homes. Due to staff shortage and heavy demand on this service there was, at the end of the year, a delay of up to 3 months in providing treatment. This is an unsatisfactory state of affairs which will continue until sufficient chiropodists are trained. The possibility of establishing a training school for chiropodists in Northern Ireland may have to be considered if the efficiency of this essential service is not be be seriously jeopardised.

Liaison with Hospitals and General Practitioners:

The value of close liaison between local authority, health visiting and nursing staff is becoming more widely appreciated and it is pleasing to report an encouraging degree of co-operation. As doctors' practices in the City tend to be very scattered and health visitors are allocated to geographical areas, exclusive attachment of health visitors to practices is not practicable except in the case of one large group practice. However, formal attachment has been established between 52 doctors and 20 health visitors and these numbers will be increased as present staff shortages are overcome and more doctors combine in group practice. A number of health visitors who have been specially trained in the care of the mentally ill devote part of their time to the visitation of these patients in their homes. They visit mental hospitals and work in close association with Psychiatrists and Psychiatric Social Workers. Two health visitors are also engaged in the supervision of diabetic patients in the community, being attached to the metabolic unit of the Royal Victoria Hospital. A further example of close co-operation between health visitors and hospital staffs is seen in the visitation of tuberculosis and chest cases under the guidance of Chest Physicians of the Central Chest Clinic. It has also been possible, for several years, to arrange for domiciliary midwives to assist general practitioners in running their ante-natal clinics. This co-operation is of great value in ensuring continuity of ante-natal care and prompt attendance to expectant mothers.

General Sanitary Services:

With the additional work involved in slum clearance and redevelopment and the implementation of the Offices and Shops and Clean Air legislation, even greater demands are being made on the hardworked public health inspectorate. Throughout the year this branch of the department continued to work well under strength, a state of affairs which may continue for some years owing to age retirements. The maximum number of students permitted by the Public Health Inspectors Examination Board (15 students) are at present under training in the department. The present course of training for public health inspectors covers a period of 3 years, the student being engaged for six months of each year on practical work in the Health Department of his training authority.

Atmospheric Pollution:

With the passing of the Clean Air Act (N.l.) 1964, local authorities were given power for the first time to clear the atmosphere over their towns and cities. The industrial provisions of the act ensure that, within seven years, dark smoke from factory chimneys will be largely eliminated. Industrialists are putting their house in order and less smoke than previously is now emitted from factory sources. More than half the smoke in the atmosphere comes from the domestic open fire burning raw coal and it can only be through the establishment of Smoke Control Areas that the problem will be eventually solved. In December 1966, the Health Committee submitted their proposals for a five year phased smoke control programme to the Ministry of Health and Social Services. This entails the setting up of five smoke control areas including a total of 11,283 houses, and covering an area of 1,503 acres. The first area bounded by West Circular Road, Springfield Road, the City Boundary and Ballygomartin Road should be in operation in October 1968.

This report contains statistical information as required by the Ministry of Health and Social Services and the officers in charge of each section give a detailed account of the various duties carried out by each division.

I would like to express my grateful thanks to the Chairman and members of the Health Committee for their continuing support and encouragement in furthering the cause of health in the City; to the Town Clerk, the Deputy Town Clerk, Heads and other officers of Corporation Departments with whom my work is closely associated and finally the staff of the Health Department for their continued conscientious service and for their loyalty, co-operation and support throughout the year.

I have the honour to be

My Lord Mayor, Ladies and Gentlemen,

Your obedient servant,

J. McA. TAGGART,

Medical Officer of Health and Port Medical Officer.

NOTES:-

Whooping cough—notifiable only as the first case occurring in a household within a period of 3 months Measles—notifiable only as the first case occurring in a household within a period of 2 months.

COMMUNICABLE DISEASES

The year 1966 started with epidemics of influenza: there were three waves of infection due, according to the virologists, to influenza virus types B, A and C, in that order. The second wave, due to type A, was the most extensive and severe: school children were most involved, the attendance at some primary schools dropping below 50%. There were 106 deaths certified as due to influenza, all in the older age groups; in fact, 70% of such deaths were persons over 75 years of age.

None of the notifiable diseases reached epidemic proportions, in spite of the fact that measles and whooping cough epidemics were overdue. However, infantile gastro-enteritis remained a problem throughout the year, with a slight increase in notifications and deaths over recent years. Bacillary dysentery, mainly confined to young children, retained its mild character, but outbreaks in nursery and primary schools result in considerable absentecism. Food poisoning cases were infrequent and sporadic. Ten notifications were received but, on bacteriological investigation, only six gave positive results. The organism isolated from all cases was Salmonella typhimurium. No evidence was found which would incriminate any particular foodstuff or other source of infection.

One case of poliomyelitis was notified. This was a young woman, employed as a cinema usherette, who complained of backache and had a flaccid paralysis of both legs. No virus was isolated from the patient and there was no rise in blood antibody titres. She made a complete recovery. All residents in the street where she lived were offered and accepted oral polio vaccine. The girl's parents were quite cynical about this procedure as they claimed that the girl had previous attacks of a similar illness due, they said, to the weight of the serving tray, stacked with ice-cream and soft drinks, which usherettes have to load from a refrigerator and carry out among the cinema patrons. One could well believe that a hospital consultant might not be aware of this sydrome!

There was the usual complete absence of diphtheria and typhoid fevers.

Tuberculosis: A rise in the annual number of new cases in 1965 to 221 has been followed by a substantial fall in 1966 to 176 cases – a reduction of 20%, to which all age groups have contributed. In 1959, with the dissolution of the Northern Ireland Tuberculosis Authority, nurses with extensive experience in visiting tuberculosis cases were transferred to the Health Authority and eventually integrated into general health visiting duties. Tuberculosis control duties were then allocated to district health visitors along with their other duties. It became increasingly obvious that this administrative arrangement was not working well. Health Visitors with no experience of tuberculosis control work found it difficult to pick up the procedure when they had only two or three cases per year and the long experience and skills of the former tuberculosis health visitors were not being fully utilised. A reversion to the former arrangement appeared to be to everyone's satisfaction.

Immunisation and Vaccination

Smallpox Vaccination: this is advised for infants when they reach their first birthday. In 1966 only 488 such vaccinations were performed, representing 6% of the annual birth rate. It is obvious that neither doctors nor parents are satisfied that the not inconsiderable upsets of vaccination should be incurred in the absence of smallpox. In contrast, 15,772 international certificates of vaccination were presented to the Health Department for authentication during the year. The great majority of these were on behalf of elderly persons intending to visit their relatives in North America. This amount of vaccination among the elderly does not pass off without upset to some patients, even, on the rare occasion, resulting in a fatality.

Immunisation against diphtheria, whooping cough, tetanus and poliomyelitis is available at child health clinics and at most general practitioner surgeries.

Parking Meter Scheme — Exemptions

With the introduction of a parking meter scheme in Belfast, the Health Department was asked to assume responsibility for the medical examination of persons suffering from a severe physical handicap who claimed exemption from charges and time limits for parking. To the end of the year, 83 such applications had been made. Classified according to type of physical handicap, the three main groups were poliomyelitis (20 cases); amputation, of, or severe injury to, one leg (16 cases) and arthritis (12 cases).

It was decided that the qualifying medical condition should be a considerable restriction of mobility, demonstrated to the medical examiner's satisfaction. Many border-line cases entailed repeated observations at work and in the street. Generally, reference to the applicant's general practitioner or consultant produced an emphatic support of the application, even in cases where it

was obvious that the disability in no way interfered with the applicant's mobility. Some applicants claimed a history of chest pain, breathlessness and a diagnosis of cardiac ischaemia. Most of these were business and professional men (including a doctor) whose way of life appeared to consist of travelling everywhere by motor car and, between journeys, short bursts of physical activity ending in breathlessness. Explanations of how they might get around in reasonable comfort and yet provide themselves with sufficient exercise to improve their cardiac efficiency fell on deaf ears, as such a regime entailed some walking. In contract, some poliomyelitis cases were seen with extensive paralysis of muscles of the trunk and two or more limbs: their cheerful outlook and will to overcome all disabilities, even without artificial help, was most inspiring.

Amputation of leg(s	s)	 	 	 10

			Total	 81

(Note: the exemption of disabled persons from charges and time limits at parking meters is restricted to those whose daily regular place of work is within the parking meter zone).

W. J. McLEOD, M.D., D.P.H., D.P.A., Ph.C.,

Deputy Medical Officer of Health.

REPORT OF THE CHIEF PUBLIC HEALTH INSPECTOR FOR 1966

Staff Matters and Pupil Training

Three final year students passed their examinations and were appointed as Public Health Inspectors. Three new pupils were appointed to maintain the strength of pupils under training at 15. A large number of Inspectors are due to retire on reaching the age limit within the next five years, so that training at the present strength must continue for some years to come. Vacancies occur each year and are advertised in the local Press and they present excellent career prospects for young men keenly interested in public health. It is a worthwhile profession, interesting and varied, making an important contribution to the well-being of the community.

In addition to the appointment of the three newly qualified Inspectors there were three other appointments made of Inspectors – 2 from London and 1 ex-Kenya. Unfortunately this increase in strength was off-set by the retirement on age of 3 Inspectors and the resignation on appointment elsewhere of another 3. This left the strength of the Inspectorate as it was with 15 vacancies. There is no doubt that this Branch of the Department is seriously under-staffed and, with new legislation dealing with Clean Air, Offices and Shops and Housing adding to their duties, the Inspectors have their hands full in dealing with the increasing calls made upon them.

Slum Clearance and Redevelopment

Due to a variety of reasons the Redevelopment programme has not gained the momentum hoped for: nevertheless demolition and re-building is taking place in 3 of the Redevelopment Areas which had approximately 2,400 houses. It is hoped that in the incoming year the first occupants of the new dwelling units in the Redeveloped Areas will have moved in. Almost 1,000 unfit houses and pre-fabricated bungalows were closed and the majority of them demolished during the year. Mention is made elsewhere in the Report of the great problems associated with keeping this class of accommodation in habitable repair pending closure and demolition. In the Housing Section of this Report the typical housing conditions found in Redevelopment Areas are described and the experiences of the Housing Trust in dealing with one of these areas make interesting reading.

Food Inspection

Statistical information and other details in this Section of the Report again illustrate the ever increasing flow of legislation which covers our daily food. Regulations on compositional standards, control of additives, preservatives, colouring matters, and further labelling requirements have been added to the already long list of regulations dealing with the food we eat. In emphasising this point, mention is made of an interesting recent comment on the application of Food Regulations to the humble fruit loaf. This may contain most of the following:—

Bleaching agent (flour);
Antioxidants (fats);
Colours, synthetic;
Flavours, synthetic;
Preservative (fruit);
Emulsifiers;
Stabilizers;
Buffers, Nutrients, Sequestrants;
Mineral Oil;
Anti-caking and-staling agents;
Pesticide residues;
Insect contaminants;
"Foreign bodies."

Two typical examples of the varied work of this Section were investigations into possible health hazards associated with the use of a certain type of can opener, and "pink elephants" – a plastic envelope in the shape of an elephant, filled with water and then frozen as an alternative to ice in spirits. Appropriate action was taken in both instances. Complaints of foreign matter in food would appear to be on the increase and range from insects, dirt, moulds, etc., to metal objects, pieces of plastic rubber and glass, illustrative of the mechanisation of the food industry.

Poultry Inspection

At least thrice-weekly inspections are made of the 4 premises wherein poultry are killed for retail sale. Approximately 40,000 birds were inspected during the year and details of conditions and action taken are recorded elsewhere in this Report. With weekly inspection of the markets, routine inspections of poulterer's and butchers shops, allied to inspection in the poultry packing stations, quite a good control is exercised over the sale of poultry to the general public. 100% inspection of poultry is neither practicable nor feasible.

Meat Inspection

As a follow-up to the procedure adopted in Abattoirs for dealing with carcases affected with Cysticercus Bovis, the Food Inspectors visit cold storage depots to ensure that carcases sent there for treatment are retained for the prescribed period.

Air Pollution

The City's first Smoke Control Area will be made in 1967, to be followed within the next five years by several others. These areas are closely associated with the Redevelopment Areas which are also to be smoke control areas. A large number of individual owners are installing central heating using oil, gas, electricity or solid fuel, all of which help to clean up the atmosphere. In the industrial field very few hand-stoked boilers using solid fuel are left.

Offices and Shops

The Office and Shop Premises Act (N.I.) 1966, which follows closely a similar Act in England, has been hailed as a major piece of social legislation dealing with the health, safety and welfare of employees in such premises and comes into force in 1967. Certain provisions of the Act which could require the carrying out of structural alterations will come into force on subsequent dates.

Examination of Plans

181 plans were received from the City Surveyor's Department for examination as to compliance with public health legislation. New boiler installations, with legal requirements for new chimneys to be of sufficient height to ensure adequate dispersion of fumes and minimal ground level concentration of sulphur gases, lead to much discussion with Architects and Consultant Engineers. Agreement is reached when it is generally accepted that the efficient dissemination of flue gases is essential for the well-being of the community.

Acknowledgments

The help and assistance given and the good liaison with our staff and the staff of other Corporation Departments including the City Surveyor's, City Architect's, and Estates Superintendent's and the staff of the Belfast Water Commissioners is gratefully acknowledged and much appreciated. Appreciation is also recorded for the help given in the compilation of this section of the Annual Health Report by the senior officers of the Atmospheric Pollution, Housing, Port Health, Factories and Shops, Food and Drugs and Pests Control Sections and the clerical staff of the Sanitary Branch.

SEWERAGE, SEWAGE DISPOSAL, LAND DRAINAGE AND RIVER WORKS

The following information is supplied by the City Engineer and Surveyor and some of the works described will, when completed, eliminate causes of complaint to the Health Department. The development of the Bog Meadows, the culverting of the Farset River between Shankill Road and Lawnbrook Avenue, the piping of the Taughmonagh Stream, and the laying of a sewer to serve the Hampton Park-Annadale area are examples of such works.

The following is an extract from the Report on the work of the City Engineer and Surveyor's Department for 1966;—

The work under Contract No. 1 in connection with the development of the Bog Meadows is progressing and the new pitched channel for the Blackstaff River is two-thirds complete. Stream diversions in 42" and 60" dia. piping are 90% complete. The construction of new sewers is well advanced, the high level being 90% complete and the low level 80%. Work is proceeding on the $1\frac{1}{2}$ mile long

7 ft. 6 in. internal diameter High Level Intercepting Sewer between Mervue Street and the intersection of Argyle Street and Ashmore Street. This sewer is being carried out entirely in tunnel and approximately \(\frac{3}{4} \) mile of the outer segmental rings of the tunnel has been constructed. The culverting of the Farset River between Shankill Road and Lawnbrook Avenue should be completed early in 1967.

The new pumping station at Glenmachan Street was completed and is now in operation. Work was completed on the piping of Taughmonagh Stream and also on the laying of the sewer to serve the Hampton Park–Annadale Avenue area. Plans have been completed for the relaying of the Springfield Road Sewer between West Circular Road and Springfield Park and it is expected that tenders will be invited early in 1967.

REFUSE COLLECTION AND DISPOSAL

The work of the Cleansing Section as far as refuse collection is concerned has again increased slightly over the past year, bringing total household collection to 5,000 tons per week and this, with 500 tons of street sweeping and 300 tons of trade refuse, was disposed of at Duncrue Street tipping ground. The Harbour and Holywood Road tips are now closed and the whole of the City's refuse is being tipped at Duncrue Street. In addition, Castlereagh and Holywood, who have lost their tipping grounds, are temporarily using Duncrue Street.

Two new 40 cubic yard, one 50 cubic yard and two 35 cubic yard capacity refuse collection vehicles have been ordered this year, together with two suction sweepers and four gully emptying machines and one combined cesspool and gully emptying machine. Two hundred free-standing litter boxes have now been erected. In the event of a severe snowstorm 21 snow ploughs are ready for immediate use, together with 12 bulk gritters. A register of contractors with plant for hire has been compiled and approximately fifty mechanical shovels and 160 tipping lorries could be called upon if required. The bulk bin service has again expanded rapidly and 219 of these bins are now on hire.

WATER SUPPLIES

The Belfast City and District Water Commissioners supply the City with water from a number of catchment areas and reservoirs under their control. The Health Department is kept informed of any new developments and works and are supplied with results of chemical analyses and bacteriological examinations. We, in turn, supply the Commissioners with results of bacteriological examinations of samples collected by our staff and submitted to the Central Public Health Laboratory.

Water Samples collected by the Health Department staff from consumer's taps

During the year the total number of samples thus taken was 296. Of this number 274 were reported as highly satisfactory, and the remaining 22 samples were unsatisfactory. The results of the unsatisfactory samples are as follows:—

TABLE B1

Coliform organisms (per 100 ml.)	Samples	Coliform Organisms of faecal origin (per 100 ml.)	Samples
1—3	20	1—3	6
4—10	1	4—10	1
Greater than 10	1	Greater than 10	_

⁷ samples contained both faecal and non-faecal coli.

Water samples collected by the Health Department staff from consumers' taps in tenements

In all, 299 samples were taken for bacteriological examination and of these 265 were reported as highly satisfactory. 34 were regarded as unsatisfactory because of the presence of coliform organisms. Although these samples were mostly of tank water, a high percentage was reported as satisfactory. Our officers advise the occupants of the tenements not to use such water for drinking or cooking purposes.

Samples of water from mineral water manufacturers

135 samples of mains water were taken for bacteriological examination and of these 130 were returned as highly satisfactory. 5 were classified as unsatisfactory due to the presence of coliform organisms. 39 samples of private supplies in use for manufacturing purposes were taken and the Bacteriologist reported 32 of them as highly satisfactory. The remaining 7 were classified as unsatisfactory due to the presence of coliform organisms of faecal and non-faecal origin.

Domestic supplies for wells and springs

Of 264 samples taken, only 63 were reported as satisfactory. The remaining 201 samples were shown to have coliform organisms of faecal and non-faecal origin. 138 of these samples had more than 10 organisms per 100 ml. of water.

SWIMMING BATHS

Enclosed swimming baths

Two new swimming ponds were opened during the year, one at Methodist College measuring 80 ft. by 25 ft. with a capacity of 37,500 gallons. The water is treated by filtration and continuous chlorination and the pumps are capable of complete circulation of the water every four hours. The other pond opened is at Fleming Fulton Special School. The pond is approximately 200 sq. ft. in size with a capacity of 2,000 gallons. Treatment is by filtration and continuous chlorination with complete circulation of the water every three hours. There are now 8 enclosed swimming baths in the City, the others being 4 owned by the Corporation, 1 at Royal Belfast Academical Institution and 1 at the Malone Training School. Peter's Hill baths was demolished during the year as part of Redevelopment Area "A".

624 inspections were carried out during the year and 990 tests made of the water for pH and chlorine residual. 69 tests revealed that the water was not in compliance with agreed standards and the results were reported to the appropriate authorities. Of 258 samples taken for bacteriological examination, 6 were returned as unsatisfactory. Those having control of the ponds were advised of the adverse reports.

Open-air swimming ponds

There are 4 such pools in the City -2 owned by the Corporation and 2 by public schools. 85 inspections were made and 130 tests carried out for pH and chlorine residual. 40 samples of the water were collected for bacteriological examination and all were reported as satisfactory.

HOUSING ACTS (NORTHERN IRELAND) 1890-1964

Slum Clearance and Redevelopment

A vesting order was made during the previous year for Area "F1", bounded by Durham Street, Divis Street, Albert Street and Cullingtree Road. Three Public Health Inspectors from the Housing Division completed a detailed inspection of all dwelling houses in this area to ascertain their fitness for the purposes of making a Declaration of Unfitness Order. Detailed inspections of the individual dwellings within the area indicated a general state of disrepair, dampness and varying degrees of instability. Some of the houses have a fairly good frontal appearance, brought about by the occupiers having the front external walls cement rendered, or the brickwork joints pointed, or, in some cases, the entire front external walls pointed and new windows installed, but in a number of cases the cement rendering is now worn and cracked and tends to trap the rain water. In many cases occupiers have carried out extensive repairs and, in an attempt to keep out penetrating damp, have had internal walls cement plastered, which in turn has resulted in excessive condensation. Many of the main roofs require to be reslated and there was no evidence of damp proof courses. With the ageing of the dwellings (most were built between 1858 and 1883), brickwork was perished or crumbling, walls and chimney stacks in many instances were off plumb and bulged with joints open and in many cases bricks and chimney pots were loose.

Light and ventilation was often found to be poor and obstructed and few dwellings had adequate and proper accommodation for the storage and preparation of food. A number of occupiers have improvised structures in the yard space as sculleries which in most cases osbtruct the light in the

living room, are poorly constructed and are in contravention of the building bye-laws. A large number of these houses lack proper scullery accommodation and some have no sink, with the water tap in the open yard or behind the front entrance door; others have old, worn and unhygienic sinks. In some of the older houses food is stored, prepared and cooked in the living room which is used as a dining room. Washing facilities in many of the houses are non-existent and a laid on hot-water supply is a rarity. Very few of the houses in this area have internal W.C's or baths, the majority of W.C's being situated in a small (usually defective) brick apartment in the small yard at the rear. A large number of the main roofs have slipped slates and many other slates are being held in position by lead ties, indicating that the slating laths are split and unable to hold the slating nails.

Another unsatisfactory feature is that practically all the streets have no rear passages and consequently household refuse has to be carried through the living rooms by the Cleansing Department. This can cause offensive smells in the house and the possibility of soiling the floors, walls and furniture. Lack of proper fuel storage accommodation results in coal being stored in many cases in a small apartment under the stairs.

On the 13th June, 1966, the Northern Ireland Housing Trust took over the control of Area F1 and their Housing Manager made a survey of the area and found the most common complaints were generally directed against the condition of the houses themselves and lack of space and proper amenities. The Housing Manager also found that, on the whole, the majority of older people preferred to stay in the area while the younger married people were anxious to get out. This latter group, when moved, have enabled the Trust to use the vacant houses for those who wish to remain in the area as they expect to use these houses until new accommodation has been built. Some families wish to remain, saying their children were settled in the area, or that relatives lived nearby, but many expressed a fear of high rents, travelling expenses, or a complete horror of the unknown. To many old people, any district other than their own immediate neighbourhood is "unknown." Only vacant houses in good condition are being used for transferring people in the immediate demolition area, as otherwise the cost of making a poor house habitable would be excessive. It was also found that, whilst there was a high proportion of houses under-occupied by old people living alone, there existed much overcrowding and multiple occupation in the smallest of houses. The Housing Trust have had much trouble with vandalism and its cost has had to be added to their repair account. Such things occur as windows being removed from boarded-up houses on a Sunday afternoon; immediately a house becomes unoccupied lead piping is removed together with fireplaces and all fittings of value. New "playing fields" are the levelled sites of demolished houses where children find enough stones to smash windows and street lamps. As all houses are vacated, the drains are sealed up to prevent offensive smells or rat infestation.

The Housing Manager keeps in constant contact with the people in the area by way of a fortnightly rent collection and by having an office situated on the site where advice can be had at any time. This contact is obviously of prime importance. Rents (including rates) collected up to 31st December, 1966, amounted to £14,790. Repairs have amounted to £2,621. Already some 61 tenants have left the area since the middle of June, 1966:—

Deceased or left the area voluntarily		 	 18
Families housed at Andersonstown	• •	 	 31
Families housed at Suffolk		 	 5
Families housed at other Trust Estate	es	 	 7
			61

The Housing Division started a detailed inspection of areas F3 and F4 on 13th June, 1966. This is an area bounded by Cullingtree Road, Albert Street, Falls Road and Grosvenor Road and contains approximately 2,440 houses. It is expected that the area will be vested in 1967. A Public Inquiry for "Fitness" of Area F1 was held on 13th October, 1966, at which the Public Health Inspectors of the Housing Division gave evidence as to the unfitness of these houses. The result of this inquiry had not been declared by the end of the year.

Apart from redevelopment schemes, 12 individual unfit houses were represented: Closing Orders were made on 11 of these and a Demolition Order on one. The policy of rehousing the occupants of prefabricated bungalows was continued and extended to cover other sites in the City. 197 of these bungalows were closed and demolition and clearance of the sites are to follow.

PUBLIC HEALTH NUISANCES

A major part of the Public Health Inspector's duties is the discovery and abatement of statutory nuisances. The general public make such extensive use of the Department's services in this respect that there is little time left for systematic inspection of districts to discover the existence of nuisances. There are may old and sub-standard houses in the City which have long passed their normal span of life and most of these are no longer wind and water tight. A spell of stormy rainy weather is followed by hundreds of complaints to the Department. These are the "problem" houses for the Public Health Inspectors. Roofs have been repaired so often that further "darning" repairs are almost usless. Nothing short of stripping and re-slating these roofs will give any lasting protection against rain and storms. This would inevitably entail the complete renewal of roof timbers and the cost of the whole operation for a small kitchen house would be in the region of £100. Having regard to the age of the houses, lack

of amenities and very low standard of accommodation, such major repairs are not considered practical on structural and economic grounds. So it is "darn and patch" and "patch and darn" over and over again until the Redevelopment Plan for the City one day reaches the area and writes finis to these houses. Hasten the day! The keeping of these houses (many of which are let at low rentals) in a habitable state imposes financial burdens on the owners and many of them request the Department to make Closing Orders. However sympathetic the Department and the Corporation may be, it is simply not possible to accede to these requests. The Public Health Inspectors appreciate the owners' problems and only ask for urgent and necessary repairs in such houses. This in turn is not always appreciated by the occupants (or by some owners).

The samples of water were taken from the rivers and streams for bacteriological examination to check on the extent of pollution. 2 samples were satisfactory and 135 samples were reported to contain coliform organisms of faecal origin.

AIR POLLUTION

Under the Clean Air Act (N.I.) 1964 (Section 10) a local authority must be satisfied that the height of a chimney, as shown on plans submitted to them for approval, is sufficient to prevent so far as practicable all smoke, grit, dust or gases from becoming a nuisance or prejudicial to health. During the year 42 plans for buildings other than shops or dwelling houses with some form of fuel-burning plant were considered. Consideration is given to the size and type of plant, the distance from and type of adjoining buildings and the levels of neighbouring ground. The final height is calculated from the "Memorandum on Chimney Heights." In a number of cases the chimney height as suggested by the architect or consultant was insufficient and the person submitting the plans was requested to make the necessary modifications before approval was given. The method of calculating chimney height is based upon the sulphur dioxide content of the flue gases emitted and by making proper use of the Memorandum and the other provisions of the Clean Air Act. Chimneys thus provided should cause no trouble by emission of noxious gases, smoke, grit and dust.

As atmospheric pollution resulting from the combustion of fuel has a seriously harmful effect on both health and materials, the current approach is to ensure that polluting gases are discharged at heights adequate to minimise their effects at ground level. This policy has financial implications for industrialists and others whose chimneys are now required to be higher for public health reasons and the co-operation of architects, consultants and town planners is of fundamental importance. Once this is gained, however, any conflict of interest can be turned to mutual advantage, thus bringing benefit to the community. There is scope for continual research to discover practical methods of removing sulphur from fuels; until this is achieved, local authorities, industrialists and the general public must understand the necessity for accepting current practice. There is good reason too for the extension of control of chimney heights beyond the scope of present legislation, which stops short of what is essential in present day conditions.

One smoke problem which has been very prominent in recent years (and which does not involve chimneys) is the burning of disused car bodies by scrap merchants in yards and on vacant ground. Statutory notices under the Public Health Acts have been served on several persons who were carrying on this practice, but the problem is that, in most cases, the fire is of short duration and there is little evidence by the time an inspector arrives. All car dismantlers and scrap merchants have been warned regarding the practice of burning rubber tyres, car upholstery and insulated cables (for the recovery of scrap metal). Although some headway has been made with the larger established dealers, there is the problem of the individual who sets up in business on a piece of land for which no one accepts responsibility and proceeds not only to pollute the air but to despoil the area by the litter thrown around. The only answer would appear to be for a large dealer or even a number of dealers to unite and erect a suitable incinerator where disposal could be achieved smokelessly and where the cleaned scrap metal could be pressed into sizes suitable for shipping.

During the year it was decided to make a start on the big problem of domestic pollution. It was felt that the West side of the city offered the best possibility for success in this venture, mainly because the prevailing winds are westerly and any area selected would be truly smokeless and not so subject to pollution from adjoining areas. The area selected for No. 1 Smoke Control Area was 285 acres bounded by the City Boundary — Ballygomartin Road — West Circular Road and Springfield Road.

This contains 1,721 premises, a large proportion of which are Belfast Corporation property. On preliminary survey it was found that 77% of the tenants would prefer solid fuel open fires, 7% room heaters and 16% electricity. Most of the people in the area who were interviewed expressed a desire for smoke control and those who had already changed to some form of smokeless space heating were full of praise for the benefits they had derived from the changeover. It is hoped that a detailed survey of the area may begin as soon as Ministerial approval is obtained and that the order may become operative in October, 1968. A 5-year plan to introduce smoke control areas adjoining No. 1 area, covering in all 1,503 acres and 11,880 premises, is envisaged. It is hoped that this programme will be completed by 1972, when these areas would join up with redevelopment areas and extend smoke control much closer to the city centre.

While much research has been and is being done on what may be called the science of air pollution—its composition, measurement, behaviour in the atmosphere and its physical and other effects—it is surprising that, in what is essentially a social problem, there should be so little investigation into the reactions and opinions of people who are affected by it and whose well-being is the main objective of the drive to clean up the air. Much education and publicity will be necessary before the introduction of smoke control, so that a desire for smoke-free air is created, as it is of little use installing appliances to burn smokeless fuel, only to find that householders are unwilling to co-operate in making a success of a scheme in which a considerable amount of government, local authority and private money has to be expended. Opportunities for advancing the cause have been taken as they have presented themselves and many enquiries are being answered from tenants and householders from all parts of the city as to when smoke control is to be introduced within their area. The creation of a favourable public opinion is especially necessary in our No. I Area, as upon it hangs much of the success of future smoke control areas throughout the city and the abolition of the open fire burning bituminous coal.

The type of space heating being installed in new houses is causing some concern, as new dwellings, (i.e. dwelling started after 9th June, 1964), would not be eligible for adaptation grant if subsequently brought within a smoke control area. Since that date, when plans for the erection of a new dwelling were approved by the Belfast Corporation, a circular was sent to the builder or developer stating that appliances as approved by the Domestic Solid Fuel Appliances Council should be installed. Appliances in new dwellings should not therefore require conversion except for some reason such as a change in the fuel position, in which circumstances (if the Ministry of Finance approved), financial assistance could be extended to any class of new dwelling. It has, however, been found in some cases that the information has been ignored and most of these new dwellings are fitted with appliances not capable of burning solid smokeless fuels. When the attention of some builders was drawn to this fact they expressed little concern and were happy to leave the matter when it arose to the householder. When the householders (particularly owner-occupiers) find that they are not eligible for a grant under a Smoke Control Order, the inspectors carrying out a house to house survey will be involved in considerable explanations.

Measurements of air pollution continue to be made by the taking of daily recordings of smoke and sulphur dioxide and monthly recordings of sulphur trioxide and solid deposited material. Daily recordings still continue to show the inner zone stations at College Street, Templemore Avenue and Mountcollyer Street to have the heaviest degree of both smoke and sulphur dioxide pollution. Templemore Avenue (in a densely populated and industrialised area of the east of the city) has the doubtful distinction of having the heaviest pollution of smoke, while College Street in the city centre has the heaviest mean value for sulphur dioxide. These heavy concentrations occur during the winter months of November, December and January. North Road and Balmoral Avenue have the record for the lowest smoke and sulphur dioxide readings and, in general, pollution is at its lowest in the months of June and July. While the number of deposit gauges for recording solid material on a monthly basis has been reduced from 10 to 5 in recent years, the site at Ormeau Avenue still records the heaviest pollution, with October the worst month at 45 tons per square mile, this being some 4½ tons higher than the highest recording made in 1965. This form of instrument is, however, not a true reflection of the pollution of the area as a whole and is more likely to record one particularly source or chimney in close proximity.

PORT SANITARY

During the seven-week period of the Seamen's strike, arrivals were mainly from foreign ports of a number of foreign-owned vessels unaffected by the strike by virtue of being constantly engaged in coast-wise trade into the port. Many ships were laid up at Belfast and these received constant inspection in order to prevent dock-side nuisance or accumulation of swill, etc., which would have attracted rodents. For some time following the resumption of sailings, the increase in cargo into the cross-channel sheds, where space was already somewhat restricted due to demolition and other work in connection with the new passenger terminals and wharf reconstruction, made it difficult to maintain full inspection of landed foodstuffs. Until conditions returned to normal, additional visits were necessary to keep pace with cargo movement.

Included in current construction in the Harbour Estate are new passenger terminals and wharf alterations at the Liverpool and Ardrossan berths, Donegall Quay, to accommodate vessels now being built for use in the cross-channel passenger/cargo service. Special arrangements have been incorporated in wharf reconstruction and vessels to facilitate loading and discharge of vehicles. A large area of the Clarendon Dock has been reclaimed to provide a parking area for vehicles waiting shipment or collection.

Additional equipment has been provided at Spencer Basin East and the Ballast Quay for the handling of increased cross-channel container traffic. More than 500,000 tons of goods are shipped annually by this method, the services being Heysham and Liverpool daily, Garston and Preston thrice weekly. Containers engaged in food transit (and their contents) are inspected where possible. Additional wharfage is under construction, extending southward from the Richardson Wharf and fronting the Herdman Channel. On the east side of the Victoria Channel, preparatory site work has commenced on a 165 feet wide, 1,100 feet long dry-dock capable of accommodating the large tankers and other vessels now building or recently built at the shipyard. When completed it will be the largest dry-dock in Europe.

Dockers refused to discharge cargo from a vessel in which considerable rodent infestation in cargo spaces was revealed on hatch opening. The Master of the vessel and the Shipping Agent were notified of the necessity for immediate eradicative treatment and, following baiting and trapping, 32 rats were killed. During the vessel's stay in port, rat-guards were secured to all mooring lines. The Port Health Authority at the next port of discharge was notified of the conditions found and the interim measures taken. Included in the cargo was a consignment of bagged rice, in some of which rats were found to be nesting. 14 bags were found to be contaminated and these were destroyed as unfit for human consumption. Further examination of the landed cargo, in shed, revealed that infestation had extended ashore. Immediate warfarin baiting achieved complete extermination.

The sub-soil under a surface switch box in the Harbour Estate was found to be undermined by the burrowing of rats and had become a breeding place. Attack on cargo, mainly provender, in the adjoining shed soon followed. The site of the switch box was given primary treatment with warfarin and it was then excavated and filled in with concrete. The removal of timber stacks, site cleansing and restoration has reduced rodent harbourage in the areas convenient to the Pollock and Dufferin Dock Sheds into which large quantities of foodstuffs are discharged. A further instance of the creation of harbourage which quickly became rodent infested, occurred at the container bays and disused buildings at Northern Road adjoining the timber pond. The dumping of wood-wool packing, shredded paper, cartons, etc., removed from returned containers created the harbourage. Complaint was made to British Railways and the Harbour Commissioners' Traffic Control Department, following which a further extensive inspection of the area was made in company with the officials concerned. The harbourage was eventually removed and an assurance given that it would not be allowed to accumulate again.

The extent and location of the pigeon population in the Harbour Estate is influenced by the abundance and variety of readily obtainable food, mostly from spillage of grain in the immediate surroundings of silos or on adjoining roadways. Spoliation of cargo in sheds can be caused by droppings from pigeons roosting or nesting in the roof members. Where foodstuffs are likely to be involved, protection by the use of covers is insisted upon. The present method of extermination, such as mechanical trapping and destruction of nests and eggs, leave plenty of birds still at liberty. Included in the demolitions necessary in the construction of new passenger terminals were buildings in Donegall Quay Street, the unoccupied top floors of which had served as a loft for large numbers of pigeons which gained entry through broken windows. Periodically, exits were closed and the contained birds, often in large numbers, were trapped and exterminated. Future legislation permitting the use of narcotised bait should be helpful in eliminating damage to cargo stored in dock-side sheds. Starlings

do not normally inhabit the Harbour Estate in daytime. Towards dusk they arrive in enormous numbers to roost in the shipyard gantries. Recently, in order to discourage such roosting, explosive charges have been set off at the usual arrival time of the starlings, with good effect. Sparrows are few in number and they select sheds mainly used for the reception of animal feeding stuffs.

The necessity for fumigation of vessels with H.C.N. gas did not arise as rodent infestation found was mostly slight and confined to a few cargo spaces: in a few cases where it was more extensive, the retention of cargo for discharge elsewhere made fumigation impracticable. In such cases interim treatment by baiting and trapping was given during the vessel's stay in port. It may be presumed, from the reduction in number of deratting certificates issued, that the combination of half-yearly complete search of all foreign vessels and intensive shore eradicative measures has considerably reduced rodent infestation of ships.

On the 1st of May the first of a number of direct shipments, each comprising 11,000 boxes of new potatoes, arrived from Cyprus. All were found to be in a clean and dry condition and free from disease or sustained damage. Consignments, mainly of bagged cereals, at times arrive at the Cross Channel sheds, Donegall Quay, consigned "quay order" to the importer, who permits the cargo to remain stored in shed until it has been finally distributed in small lots over a lengthy period to various customers. The continual disturbance of this cargo and the fact that it remains so long in the presence of other general cargo increases the risk of contamination. Where such circumstances arose, notification to the B.H.C. Traffic Superintendent and importer or agent ensured an early removal of cargo to a warehouse.

Examination and sampling for physico/chemical analysis was made of all consignments of groundnuts in shell arriving direct from foreign ports. In no case was aflatoxin found to be present in excess of the permitted 0.05 p.p.m. tolerance. Other consignments arriving from cross-channel ports were examined visually and enquiry was made from the Port Health Authorities of ports of loading as to the result of analyses made there.

The landing of large quantities of canned fruit and (in the season) tomatoes of Channel Islands origin in a damaged condition, sustained either on voyage or in handling, has diminished. The use of wooden pallets in stowage together with mechanical handling has been helpful in this respect. Approximately six tons of fresh plaice consigned from Holland to a port outside Northern Ireland, at which (due to a labour dispute) landing was refused, was landed here in an advanced state of deterioration. Early removal for destruction was necessary to avoid odour contamination of other foodstuffs in the vicinity. 100% examination was required in the case of one consignment of fresh tomatoes from the Channel Islands which, due to bad weather on passage, had come adrift in the hold, resulting in extensive damage to crates and contents. Many of the tomatoes were pulped and remained in the hold. From those landed in a loose condition, 8 cwts. were destroyed as unfit for human consumption.

In York Dock "A" Shed leakage from drums of a mercurial product spread over the shed floor to adjoining cargo. The toxicity of this product necessitated extensive decontamination which included thorough cleansing of the floor by fire-hoses and treatment of cargo handling gear, trucks and motor lorries with a neutralising agent. Those who were engaged in the handling of cargo and others who might have been in contact with spillage from it were decontaminated and kept under medical observation for some time. The area of contamination was easily determined as the product contained a purple dye indicator. The only foodstuff in the risk area, bagged lentils, was removed to the Destructor and burned. All necessary precautions were observed during handling and the vehicle used in the removal was cleansed and decontaminated.

386 cartons of Australian beef steak with gravy which arrived in Belfast as part of a direct shipment in September, 1964, and were subsequently removed to a contractor's store, were eventually purchased by a Liverpool merchant and shipped to him in March 1966. On examination at Liverpool it was discovered that the Official Certificate was not of current issue. Enquiry here revealed that the Official Certificate was valid at the time of importation into the United Kingdom through Belfast. This information was forwarded to the Port Health Authority at Liverpool and the cargo was released for distribution. A consignment comprosing 9,629 cartons of Canadian canned ham, each containing 12 x 1½ lb. cans, which had been impounded at Spencer Basin shed since arrival from Rotterdam in December, 1964, because the Official Certificates were not of current issue and the Board of Trade import license requirements had not been complied with, was re-exported to Holland on 8th April, 1966.

Circulars relating to modification of Official Certificates for imported meat and meat products were received from the Ministry of Agriculture, Fisheries and Food, also notifications from Port Medical Officers at Cross Channel Ports of imports of food of foreign origin which on examination were found to be unsound or not marked or labelled in compliance with the Public Health (Imported Food) Regulations 1937–1948. These were noted and particular watch kept for products bearing similar marks.

Regular contact is maintained with the Waterguard Officers and the Landing and Shipping Branch of H.M. Customs and Excise, the Immigration Officers, Marine Survey Branch of the Board of Trade, the Portal Inspection Officers of the Ministry of Agriculture, the staff of the Belfast Harbour Commissioners and the Belfast and District Water Commissioners and the Harbour Masters at Bangor and Carrickfergus, all of whom have been most helpful and co-operative.

Tonnage launched by Harland and Wolff, Ltd., during 1966:—

"Sea Quest"	Drilling Platform	Gross Tonnage	7,900
"Orcoma"	Single Screw. Cargo	do.	10,509
"Nairnbank"	Single Screw. Cargo	do.	10,541
"Donax"	Single screw tanker	do.	42,068
"Ulster Prince"	Twin screw Passenger and vehicle ferry	do.	4,600
Naval tonnage:—			
"Araluen" Small Craft	New midship section		1,200 303

Among the vessels which were inspected during refit were:—

"Caronia", "Devonia". Liners:

"Alaric", "Port Launceston", "Port Nicholson", "Roxburgh Castle", "Ruthenic", "Waipawa", "Clan Mac-lachlan", "Crystal Bell", "Crystal Crown", "Delphic Sky", "Kungsholm", "Storstad", "Gitte Petersen", "Garoufalia", "Hemussite", "Julia", "Olga", "Kathar", "Otterburn", "Trefusis". Cargo Vessels: (foreign-going) Also the vessels of the Head Line fleet.

"Ardiatic Coast", "Hibernian Coast", "Hadrian Coast", "Caledonian Coast", "Mayfair Sapphire", "Michael Petersen", "Spaniel", "Stormont", "Colebrooke", "Talisker", also 11 Cargo vessels: (coast-wise)

colliers of the John Kelly Ltd. fleet.

"British Vine", "British Trust", "Texaco Maracaibo", "Verena", Tankers:

"La Estancia". Ore carrier:

"Duke of Rothesay", "Duke of Lancaster", "Duke of Argyll" Cross-channel cargo/ "Irish Coast", "Scottish Coast", "Innisfallen", "Leinster", "Munster", "Ulster Monarch", "Ulster Prince", "Royal Scotsman", "Royal Ulsterman". passenger vessels:

Naval and Royal Fleet

auxiliaries:

4 vessels.

Amount of shipping entering the port during the year 1966

TABLE B 10

The Aliens Order 1953 (S.I. 1671/1953)

Under Articles 30 and 33 of the above Order, Dr. J. McA. Taggart, Dr. W. J. McLeod and Dr. A. L. Walby have been appointed by the Ministry of Health and Social Services as Medical Inspectors for the Port of Belfast for the purposes of the Order.

Ships carrying aliens including those granted temporary shore leave

210 inwards; 94 outwards

Aircraft carrying aliens

62 inwards; 54 outwards

Water supply

(a) and (b) for the port and shipping:—

The port fresh water supply is obtained from the Belfast City and District Water Commissioners' mains which feed the Belfast Harbour Commissioners' quayside mains and hydrants. Vessels are supplied from quayside hydrants by the use of meter/standpipes and hoses under the control of the Water Commissioners.

(c) Water boats:—

There are no water boats at the port.

Water Sampling

39 samples of drinking water were taken on board vessels and submitted to the Central Laboratory for bacteriological examination. 29 of these samples were found to be highly satisfactory and 10 samples unsatisfactory due to the presence of coliform organisms. In 4 of the unsatisfactory samples, organisms of faecal origin present. Where examination revealed contamination the ships' water tanks, pumps and systems were thoroughly flushed and chlorinated with effective results in every case.

Public Health (Ships) Regulations (Northern Ireland) 1954-1964:—

Arrangements for dealing with Declaration of Health forms:—

Declaration of Health forms as recommended by the Association of Sea and Air Port Health Authorities of the British Isles are in use at the port. Special instructions relative to the Port of Belfast are given on the fourth page and a supply of these forms is distributed to H.M. Customs Officers and the Belfast Harbour Commissioners for the use of the Pilotage service.

A Declaration of Health form signed by the master and countersigned by the Ship's surgeon (where one is carried) is received from each ship arriving at the port from a foreign port. The Declaration of Health form is received by the Customs Officer or the Port Public Health Inspector on the arrival of the ship. The answers to the questions contained in the Declaration are scrutinised and supplementary questions asked. In cases where the Customs Officer first boards the ship and Declaration of Health is satisfactory, pratique is granted. If the Declaration of Health is not satisfactory, the circumstances are immediately reported to the Port Medical Officer, who makes investigations before

passengers or crew are allowed to land. Ships arriving at the port are required to display the appropriate quarantine signals as laid down in the regulations. 560 completed Declaration of Health forms were received from vessels arriving at the port from foreign ports other than "excepted ports."

Boarding of ships on arrival:-

All ships arriving from a foreign port are boarded on arrival by an officer of H.M. Customs and an officer of the Port Sanitary Authority.

Notification to the Authority of inward ships requiring special attention (wireless messages, land signal stations, information from pilots, Customs officers, etc.):—

Arrangements for the transmission of wireless messages from inward bound ships requiring special attention under the Regulations have been made with the various shipping companies and agents in Belfast. Under the arrangements the shipping companies receive the wireless message required under Regulation 13 and forward the information to the Port Medical Officer. Alternatively, or in addition, wireless messages are received direct by the Port Sanitary Authority, the telegraphic address "Portelth, Belfast" having been registered for this purpose. (Regulation 14 (1) and (2)). No land signalling system is in operation. Close co-operation exists between the Port Sanitary Authority and the Officers of H.M. Customs and notifications of ships requiring special attention are received from the latter.

Mooring stations designated under Regulations 22 to 30:—

With the concurrence of H.M. Customs and the Belfast Harbour Commissioners, the ordinary places of mooring, discharge or loading have been designated mooring stations in relation to inward ships from foreign ports.

Experience of working of Regulation 18: restriction on boarding or leaving ships:—

In carrying out the provisions of this Regulation during the year no difficulty arose and it was not necessary to require passengers to furnish names and destinations, etc., as there was no case of infectious disease on board any ship arriving at the port which required this procedure.

Arrangements made for:-

Regulation 5 (c) (i): Premises or waiting rooms for medical inspection—

There are at present no premises set apart as a Customs examination hall, waiting rooms or rooms for medical inspection of passengers, as there are no direct passenger sailings between this port and foreign ports. Passengers who arrive by direct cargo ships from foreign ports are examined, if necessary, on board the particular ship.

Regulation 5 (c) (ii): Premises for temporary isolation of persons as required by the regulations:—
None provided.

Regulations 5 (c) (iii): Cleansing, disinfecting or disinfestation of ships, persons or clothing:—
After the removal of a case or cases of infectious disease, disinfection of the ships is carried out by the Port Public Health Inspectors. Clothing and other effects are removed to the Health Committee's Disinfecting Station, Laganbank Road, where they are subjected to steam pressure disinfection. The cleansing of persons is also carried out at this station at which suitable facilities have been provided for this purpose.

Regulation 5 (d): Arrangements for reception into hospital of persons as required by the regulations:—

The N.I. Hospitals Authority make provision for the reception of cases of infectious diseases at the Northern Ireland Fever Hospital at Purdysburn. Separate premises situated in the hospital grounds, but self contained and isolated from the other hospital buildings, are available for the reception of cases of smallpox.

Regulations 5 (e): Ambulance transport:—The port makes use of the facilities provided for ambulance transport in the City by the N.I. Hospitals Authority.

Regulations 5 (f): Supervision of contacts:— 3 notifications regarding contacts of infectious diseases were received from other Sea and Airport Health Authorities during the year.

Regulation 9: Arrangement for the diagnosis and treatment of venereal diseases among seamen under

international agreement:-

Upon the arrival of a ship in the port, the Master is informed of arrangements for the diagnosis and treatment of venereal disease amongst the seamen. Pamphlets are left which give the location and time of V.D. Clinics and warning of the danger of venereal disease. If continuation of treatment at another port is necessary, the seaman's V44 is completed by the Medical Officer of the V.D. Clinic with particulars of treatment given. The Belfast Harbour Commissioners have permitted the display in the port area of Health Department notices warning of the necessity for diagnosis and information on treatment centres.

Arrangements for interment of the dead:—

These are dealt with by the shipping companies or their agents.

Cases of notifiable and other communicable diseases landed from ships (including coastwise ships)

TABLE B 14

Diseases	Cases dur	ing 1966	Ships	Average cases
171564565	Passengers	Crew	concerned	for previous five years
Influenza Malaria Measles	<u> </u>		1 1 2	2 1

Mental Migraine Pleurisy Pyrexia of Unknown Origin Rash Venereal Disease	1 1 2 10	

Measures against rodents

Steps taken for detection of rodent plague:—

On ships in port:—All ships arriving from ports where plague is endemic are boarded by the Port Public Health Inspector as soon as possible after berthing. Enquiries are made as to the prevalence of rats on board, and as to whether any sick or dead rats were found during the voyage. The ships are then inspected to ascertain the degree of rat infestation, and are periodically inspected during the time they remain in port in order to ascertain if any dead rats have been found in the cargo.

Measures taken to prevent the passage of rats between ship and shore:—

All ships arriving from foreign ports are required to affix rat-guards to all moorings and maintain them so affixed during the time they are in port. It is also recommended that the gangway or other communication with the shore should be raised at least eighteen inches from the ground.

Methods of deratting:—

- (a) On ships:—Eradication measure in a vessel are influenced by the extent and location of the infestation. Where such is slight and confined, trapping and warfarin baiting will suffice. In other cases fumigation with hydrogen cyanide is resorted to. The latter is carried out by authorized contractors and in accordance with the provisions of the Hydrogen Cyanide (Fumigation of Ships) Regulations (Northern Ireland) 1952 and under the supervision of the Port Public Health Inspectors.
- Premises in the vicinity of docks, quays, etc:—Sheds, wharves, roads and open spaces in the Belfast Harbour Commissioners' Estate receive routine warfarin baiting. Occupiers of premises within the Estate readily accede to requests for provision of rodent repressive treatment at their premises, When necessary a written notice under the Rats and Mice (Destruction) Act, 1919 is served on the occupiers of the premises concerned.

Measures taken for detection of rats:—

- (a) On ships:—Vessels arriving in the port are inspected by the Port Public Health Inspectors and Pests Officer to ascertain the presence of rodent infestation, the extent of same or any condition which would encourage infestation.
- (b) On shore:—Sheds, stores, other buildings and structures also timber stacks and open spaces receive continual inspection.

Inspections made by Pests Officer:—

Vessels								1,435
Dockside	premises	s, sheds,	stores,	timbe	r-stacks,	building	and	
	ut berths			nds				1,043

Ratproofing:—

(a) Extent to which docks, wharfes, warehouses, etc., are ratproof:—

The quaysides of docks and basins in the port are mainly of solid granite construction with ferroconcrete or granite sett surfacing. In the case of jetties, wharves and quay extensions, some rat harbourage does exist in the under-jetty piling and frame work also in the stone facing of the river bank but the rat passage from one to the other is restricted by the sound construction of quayside surfacing. The use of concrete and/or granite setts laid on concrete in the construction of roads and shed floors ensures effective ratproofing in sheds and other dockside buildings.

- (b) Action to extend ratproofing:—
- (1) In ships:—Efforts are directed towards restricting free movement in vessels and preventing access to such attractive spaces as bilges for water, under ceilings, sheathing or casing for nesting and food stores. The use of tight fitting steel doors, sheet metal and expanded fine-mesh metal assures perfect protection.
- (2) On Shore:—Dock-side premises receive inspection to ensure that they are maintained in sound condition against the entry and harbourage of rodents also that material favourable to harbourage and feeding is not permitted to accumulate. Most owners and occupiers of premises in the port area are fully aware of the damage to merchandise caused by rodents and adopt all practicable measures to prevent their entry.

On 14 occasions accumulations of material offering rodent harbourage were turned over, restacked or removed and ratproofing was made good in 8 cases.

(1) On ships:—

TABLE B 17

Species	Jan.	Feb.	Mar.	April	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Total
Black Brown	2	_	2	3	_	1	3		2	8	2		23

In addition to the above, 8 mice were destroyed.

(2) In docks, quays, wharves, warehouses etc .: --

TABLE B 18

Species	Jan.	Feb.	Mar.	April	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Total
Black Brown	3 2	8	3 4	4 2	3	2	4 2	=	3	=	4	9	43 11

In addition to the above, 16 mice were destroyed.

The number of rats destroyed in the above table were those reported to the Port Public Health Inspectors and Pests Officer, following enquiry from sweepers, storemen, pests eradicating operators, etc.

Measures of rat destruction on plague "infected" or "suspected" ships or ships from plague infected ports which arrived at the port during the year:—No plague infected or suspected ships arrived at the port during the year.

Deratting Certificates and Deratting Exemption Certificates issued during the year

TABLE B 19

			Deratting	De-				
Net tonnage	Ships	After fumigation with			After	Total	ratting	Total certi-
		HCN	Sulphur	HCN and sulphur	trap- ping, poison- ing, etc.	Iotai	emption certi- cates issued	ficates issued

It was not necessary to issue formal written notices on any occasion as in every case of verbal notice to Masters, Duty Officers, Owners or Shipping Agents (and, where vessels were undergoing refit, Marine Superintendents and Shipyard Managers) of nuisances and other defects, remedial action followed. Nuisances and other defects arising from defects in original construction of vessels, also any contravention of the Merchant Shipping (Crew Accommodation) Regulations, 1953, were notified to the Nautical Officers of the Board of Trade, Marine Survey Branch. The increase in occurrence (with likelihood of consequent contamination to ships' drinking water) of discharge of faecal matter and galley waste, through ships' overboard discharges on to the dockside surfaces and their hydrants, made it necessary to obtain the assistance of the Belfast Harbour Master to eliminate this practice. Berthing Masters have been directed to notify Masters of vessels on arrival, of the prohibition of such discharges and the penalties for infringement. Verbal notice was given to Masters and Chief Officers of 28 British vessels and 18 other nationalities by the Port Public Health Inspectors, requiring immediate cleansing and protection against recurrence.

Food Inspection

Action taken under the Food and Drugs Act (Northern Ireland) 1958 and Regulations made thereunder:-

The following samples of food were taken and submitted to

(a) the Central Laboratory for bacteriological examination:—

Bacon grill 1; canned prawns 2; chopped ham with pork 2; corned beef 1; desiccated coconut 12.

In no instance were intestinal pathogens isolated.

(b) the Public Analyst for chemical analysis:—

Chopped pork with ham 1; condensed tomato puree 1; Danish cream 1; flaked peanuts 2; groundnuts 6; instant mashed potatoes 1; lambs' tongues 1; lentils 1; mixed pickles 1; peeled tomatoes 1; pilchard in tomato sauce 1; pink salmon 1; pork luncheon meat 1; red cherries in sugar 1; red cherries in syrup 1; sausage rusk 1; sausage seasoning 1; soft herring roe 1; strawberry jam 1; tea 2.

Analysis showed all samples to be genuine.

All cargoes of foodstuffs on board vessels, in containers or stored in dockside sheds and ware-houses were kept under continuous observation and inspected regularly for the detection of unsound food or infringements of the Regulations made under the Food and Drugs Act (Northern Ireland) 1958 pertaining to labelling, handling and conveying of foodstuffs.

Shellfish:—Information respecting any shellfish beds or layings within the area under the jurisdiction of the Port Sanitary Authority, stating whether they are, in the opinion of the Port Medical Officer, liable to pollution:—There are no layings of shellfish within the area.

Report of any action under the Public Health Shellfish (N.I.) Regulations 1936 or the Food and Drugs Act (N.I.) 1958:—None taken. Under the Belfast Corporation Act 1930, it is an offence to gather shellfish within the area under the jurisdiction of the Belfast Sanitary Authority. Posters are exhibited in the vicinity of the Port area, warning the public against the gathering of shellfish.

Number observed longer than thos	dischargi	ng dark s	moke co				
during a continu	ious perio	d of 30 n	ninutes				17

Verbal notice was given by the Port Public Health Inspectors to Masters, Chief Engineers, and Ships' Managers on 13 occasions regarding the volume and duration of emission of dark and black smoke from ships' funnels. In every case immediate remedy was effected. Opportunity is taken, especially when visiting vessels which use steam in heating or propulsion, to contact Chief Engineers with a view to preventing emission of dark smoke from funnels while vessels are in the port.

Routine and other inspections, additional to those tabulated elsewhere in the Report:—

705 visits to cross-channel passenger vessels.

1,150 re-inspections regarding defects, etc.

160 inspections regarding issue of Deratting and Deratting Exemption Certificates.

FACTORIES AND SHOPS

Plans received from the City Surveyor's Department concerning alterations to existing buildings and erection of new buildings were examined and reported on as follows:—

Bakeries			 	 	4
Bookmakers' Offic	es		 	 	2
Bread shops			 	 • •	3
Chemists			 	 • •	1
Church buildings			 	 	2
Clubs			 	 	2
Factories		• •	 	 	10

In addition to the provisions of the Factories Acts relating to Local Authority responsibilities, factories are also subject to the provisions of the Public Health Acts in so far as public health nuisances are concerned. Consequently, during visits to factories, such nuisances as damp conditions, structural defects, etc., are actioned under the Public Health Acts. Details are as follows:—

Inspections of factories and workplaces under the Public Health Acts (N.I.) 1878 to 1926 and the Belfast Corporations Acts 1845 to 1961:—

Bakehouses

There were 201 bakeries on the Department's register at the end of 1966 (5 fewer than in 1965). 1,217 visits were made in connection with the Food Hygiene (General) Regulations (N.I.) 1964, the investigation of foreign matter in foodstuffs and inspections during the course of re-building and alterations.

The table below sets out particulars of the conditions found in bakehouses and the action taken by the Department.

TABLE B 26

Defects	Instances	Notices	Remedied	Out- standing
Want of cleanliness in food rooms	20	8	18	5
Food rooms required redecoration	79	43	71	14

food by insects, dirt, animal or otherwise	34	27	28	6
Unsuitable First Aid equipment	6	6	5	1
Other defects	12	8	12	6
Totals	244	151	210*	77

^{*} Defects remedied include defects outstanding from the previous year.

Bakehouses

The following foodstuffs examined in bakehouses were found to be unfit for human consumption and were surrendered and destroyed:—

40 lbs. wheat meal; 198 lbs. flour; 50 lbs. golden ginger powder; 30 lbs. baking powder; 80 lbs. salt; 22 packets biscuits; 5 swiss rolls; 4 cakes; 12 lbs. marzipan; 4 jam rolls; 60 packets potato crisps; 3 lbs. piping jelly; 20 lbs. milk powder; 3 lbs. ground mixed spice; 14 lbs. potato flakes; 50 lbs. rice flour; 10 lbs. dried fruit; 14 lbs. jam; 30 lbs. tinned fruit.

Bread Shops

Bread shops on register at 1st January, 1966	 	336
Deletions	 	14
Additions (new premises)	 	31
Bread shops on register at 31st December, 1966	 	353
Inspections during the year	 	1,498

Defects	Instances	Notices	Remedied	Out- standing
Want of cleanliness of food rooms Want of cleanliness of persons handling food Ventilation inadequate or not maintained Drain inlets within food rooms Ceilings, walls, floors, windows, doors, etc., in disrepair Ceilings, walls, floors, windows, doors, etc., required cleansing Suitable and sufficient washing facilities not provided Cleanliness of utensils, benches, food containers, etc., not observed Other defects	34 4 2 - 8 1 5 1 33	21 4 2 -4 1 5 1 33	$ \begin{array}{c} 30 \\ 4 \\ 1 \\ \hline 6 \\ \hline 5 \\ \hline 23 \end{array} $	4 1 3 1 1 10

^{*} Defects remedied include defects outstanding from the previous year.

Betting and Lotteries Act (N.I.) 1957

Number of bookmakers' offices operating in	the Ci	ty	 115
Applications made to the Courts for certificat		uitability	 118
Number of certificates granted by the Courts			 115
Objections to the Courts on health grounds			 5
Applications withdrawn			 1
Applications refused by the Courts		• •	 1

One additional bookmaker's office was granted a licence and added to the Department's register during the year 1966. Of the five objections by this Department to the granting of Certificates of Suitability on health grounds, three was withdrawn because the work required to put the premises in compliance had been carried out satisfactorily before hearing by the Courts. In the other two cases Certificates of Suitability were granted subject to "Undertakings" given to the Courts by the applicants that alterations and work required by the Health Department would be carried out.

Non-Industrial Premises

There were 249 inspections of office premises during the year, most of which resulted from complaints made to the Department.

The following table gives particulars of the conditions found:—

Conditions	Instances	Notices	Remedied
Offices overcrowded	1	3	1
Offices inadequately ventilated	5	5	1
Offices inadequately lighted	3	3	5
Offices inadequately heated	5	3	3
Offices dirty		3	4
Stairways and passages dirty	8 5	4	8
Offices, etc., required redecoration	$\frac{3}{2}$	3	7
Offices not free from noxious fumes	$\begin{bmatrix} 2 \\ 0 \end{bmatrix}$	1	4

Pharmacy and Poisons Act (N.I.) 1955

Poisons Regulations (N.I.) 1956

The following is a summary of the work carried out during the year under the above-named Act and Regulations:—

Inspections	• •		• •	 	 290
Premises on Re	egister at 1s	st Januar	y 1966	 	 271
Deletions from	the Registe	er during	the year	 	 21
Additions (new	registratio	ns)		 	 6
Premises on Re	egister at 3	lst Decer	nber 1966	 	 256
Contraventions	discovered			 	6

Rag Flock Act 1911 and Rag Flock Regulations 1912

In connection with the above Act and Regulations the following work was carried out during the year:—

Inspections of premises	 	 46
Premises where rag flock is used	 	 38
Samples of rag flock submitted for analysis	 	 34
Samples in compliance with regulations	 	 32

Two samples of rag flock exceeded the standard of cleanliness prescribed by the Rag Flock Regulations, one to the extent of some 17% in which case a warning letter was issued to the firm concerned. The other case was a much more serious one, the return from the Analyst showing the sample to be some 282% in excess of the standard of cleanliness prescribed and a prosecution was instituted resulting in a fine of £5 and costs against the firm. In previous reports attention has been drawn to the inadequate and out-of-date provisions of the Reg Flock Act 1911; in those days rag flock was the principal filling material used in the bedding and upholstery trades and the Act no doubt did a useful job in so far as its very limited scope allowed. Today, however, in addition to rag flock, children's toys, bedding, upholstery, etc. are stuffed with many other types of filling materials which are outside the scope of the present legislation, consequently, in Northern Ireland, no provision is made for the control of hygiene of these other stuffing materials.

The present Act is inadequate in that it has no control over verminous conditions, dust content, etc., in stuffing materials and does not include any hygiene conditions with regard to hair, fibre, feathers, etc.

When the Rag Flock Act was introduced in 1911 it was applicable to England, Scotland and Ireland and since then it has been found necessary to have more adequate and up-to-date legislation in England, Scotland and Eire to meet the changes in the types of filling materials now used in the children's toys, bedding and upholstery industries and to make more effective and comprehensive provisions for the hygiene of these filling materials.

Shops Act (N.I.) 1946

Work carried out during the year under the Shops Act (N.I.) 1946:—

Shops on Department's Reg	ister	 	 	6,977
Complete surveys made		 	 • •	496
Inspections		 • •	 	1,927

FOOD AND DRUGS

During the year the Ministry of Health and Social Services made the following Regulations:—

The Skimmed Milk with Non-Milk Fat (Amendment) Regulations (Northern Ireland) 1966 (operative 22.7.66) extending the Second Schedule to the Skimmed Milk with Non-Milk Fat Regulations (Northern Ireland) 1961, to exempt the food "S.M.A." in liquid as well as in powder form from the requirement to bear on the label the declaration "Unfit for Babies" (or the permitted alternatives).

The Salad Cream Regulations (Northern Ireland) 1966 (operative 19.9.66). These regulations supersede the provisions for salad cream, mayonnaise and any other salad dressing in the Food Standards (Miscellaneous Foods) Regulations (Northern Ireland) 1960. The regulations specify compositional requirements for the amount of vegetable oil, and egg yolk solids contained in salad cream and requirements for the labelling and advertisement of salad cream.

The Mineral Hydrocarbons in Food Regulations (Nothern Ireland) 1966 (operative 27.8.66) prohibit, subject to certain exemptions, the use of any mineral hydrocarbon in the composition or preparation of food, the sale of food containing any mineral hydrocarbon and the consignment or delivery of any food containing any mineral hydrocarbon.

The Butter Regulations (Northern Ireland) 1966 (operative 1.9.67). These regulations supersede the Food Standards (Butter and Margarine) Regulations (Northern Ireland) 1960 insofar as those regulations apply to butter. The regulations specify compositional requirements for the amount of milk fat, milk solids and moisture in butter, including salted and unsalted butter and requirements for the labelling and advertisement of butter.

The Colouring Matter in Food Regulations (Northern Ireland) 1966 (operative 26.6.67). These regulations revoke the Colouring Matter in Food Regulations (Northern Ireland) 1961 except that the labelling provisions of those regulations continue in force for a transitional period ending on 31st December, 1967. The regulations

- 1. prescribe the colouring matter which may be added to food sold for human consumption;
- 2. limit the use of such colouring matters in or on certain named foods;
- 3. regulate the amount of arsenic, lead and copper contained in permitted colouring matters and in diluents combined with such colouring matters;
- 4. make consequential amendments to the Arsenic in Food Regulations (Northern Irelane) 1961 and the Lead in Food Regulations (Northern Ireland) 1961 and
- 5. revise the advertising and labelling requirements for colouring matter.

The Antioxidants in Food Regulations (Northern Ireland) 1966 (operative 9.12.66). These regulations revoke the Antioxidants in Food Regulations (Northern Ireland) 1961 which continue in force'

however, for a transitional period ending on 8th September, 1967. During that period, the provisions of these new regulations will not have effect in relation to the use, labelling, advertising or sale of any oxidant or of any food containing antioxidant which is in compliance with those regulations (and vice versa). The regulations:—

- 1. prohibit the sale of food having in it or on it any antioxidant other than as specified in Schedule 2:
- 2. provide that, where food contains as an added ingredient any specified food described in Schedule 2, the food may contain antioxidant of a description and to an amount specified in the Schedule for that ingredient;
- 3. provide that where food contains milk fat by reason of the addition, as an added ingredient, of any dairy product, that food may as respects its milk far content contain antioxidant of a description and to an amount permitted in relation to an amount of anhydrous fat equal to that milk fat;
- 4. prohibit the sale or advertising for sale, with a view to its use in the preparation of food, of any antioxidant which is not permitted by the regulations and impose requirements as to the labelling of antioxidants;
- 5. prohibit the description or advertisement of any food as being food intended mainly for babies or young children if it has in it or on it any added antioxidant and
- 6. provide that, where food is certified by a public analyst as having in it or on it antioxidant not permitted by the regulations, it may be treated for the purpose of section 9 of the Food and Drugs Act (Northern Ireland) 1958 as being unfit for human consumption.

Cheese Regulations (Northern Ireland) 1966 (operative 1.2.67). These regulations:—

- 1. specify requirements for the composition and description of cheese including hard cheese, soft cheese (including cream cheese), whey cheese, processed cheese and cheese spread.
- 2. apply compositional requirements for cheese, processed cheese or cheese spread sold as part of a compound product;
- 3. specify the permitted ingredients in cheese, processed cheese and cheese spread;
- 4. specify requirements for the labelling and advertisement of cheese, processed cheese, cheese spread and compound products; and
- 5. amend the Labelling of Food Regulations (Northern Ireland) 1961.

Can Openers

Early in the year an investigation was carried out on ratchet type openers, following press reports that some openers produced spiral chips of metal which could constitute a health hazard when deposited on the enclosed food. Several types of openers were submitted to the Department of Industrial and Forensic Science. Cans were opened with each type of opener and the quantity of metallic debris produced inside the can was measured. In most cases some metallic particles were produced, but not in sufficient quantity or size to constitute a health hazard.

"Pink Elephants"

Small elephants made from pink plastic material, filled with water and intended to be used when frozen for cooling drinks, were imported into the United Kingdom. They attracted considerable press and television publicity. On examination some of them were found to be leaking. Several were submitted to the Central Laboratory for bacteriological examination and, whilst no definite pathogenic bacteria were found, the contents failed to conform to drinking water standards and therefore could not be recommended.

Food and Drugs Sampling

The total number of samples taken for chemical analysis was 1070: 1018 of these were formal and 52 informal. As will be seen from the following table these samples covered a large variety of products. 34 of the formal samples were found to be adulterated and 6 of the informal samples were reported

as unsatisfactory. Minor cases of deficiency were dealt with by a warning to the persons concerned. In the more serious cases legal proceedings were instituted and fines totalling £111 were imposed.

The following table shows the number of samples procured during the past 5 years and the percentage of adulterated samples.

TABLE B 31

		Number		Adulterated			erated Percentage Adulterated

O W OOLINIA	1-11	1				

In the cases of the following samples, no legal proceedings were instituted:—beer 1; frozen eggs 1; pig's liver 1; minced pork 1; preserves 3; buttered scones 1; soft drinks 2 and sweetmilk 1.

Particulars of samples specially reported on by the Public Analyst during the year:—

Apple jelly. One sample contained only 65 per cent of soluble solids. Jams and apple jelly are required to contain not less than 68½ per cent of soluble solids (Food Standards (Preserves) (N.I.) Regulations 1960).

Beer. One sample of beer contained a skin-like residue consisting of mould, hyphae and spores, in which was entangled the body of a common house fly.

Buttered scones. The fat spread on one sample of buttered scones was composed of fat having a composition other than butter fat.

Chocolate roll. One sample of chocolate roll, slightly low in cocoa content, was reported as of inferior composition.

Fresh cream pastry. One sample of fresh cream pastry, the fat in which contained a proportion of fat other than butter fat, was returned as inferior.

Liqueur honey. One sample of liqueur honey, stated to contain alcohol equivalent to 2 per cent proof spirit and found to contain an equivalent of 1 per cent proof spirit, was reported as of inferior composition.

Liquid egg. One sample of frozen egg failed to pass the alpha amylase test, showing that the egg had not been pasteurised in conformity with the Regulations.

Marmalade. Two samples of marmalade contained an insufficiency of soluble solids. Marmalade had respectively by the Preserves Regulations to have at least $68\frac{1}{2}$ per cent of soluble solids: the samples is required $66\frac{1}{2}$ and 65 per cent.

Minced beef. One sample of minced beef contained sulphur dioxide of the order of 400 parts per million. The addition of sulphur dioxide to minced beef is prohibited.

Minced pork. One sample of minced pork contained 3 per cent of starchy filler. Minced pork should be entirely composed of pork.

Minced steak. Ten samples of minced steak contained sulphur dioxide in amounts ranging from 130 to 1290 parts per million. The use of sulphur dioxide in minced steak is prohibited.

Model American cola. One sample was tainted by traces of paraffin or some similar petroleum product and was returned as inferior.

Pig's liver. One sample of pig's liver contained 1.5 parts per million of arsenic. The Arsenic in Food Regulations (Northern Ireland) 1961 prohibits the presence of arsenic in food in an amount exceeding 1 part per million.

Sausages and sausage meat. Fourteen samples contained sulphur dioxide in amounts ranging from 520 to 2,600 parts per million. Two samples had the composition of minced beef with sulphur dioxide present. Sausage meat may contain a maximum of 450 parts per million of sulphur dioxide, when declared (Preservatives in Food Regulations (Northern Ireland) 1962).

Soft drinks. Two samples of lemonade were contaminated by traces of disinfectant. One sample of pineappleade was contaminated by traces of some phenolic substance. One sample of dry lemonade was tainted by paraffin.

Sweetmilk. One sample of sweetmilk contained only 5.7 per cent solids not fat and 1.5 per cent of fat, against 8.5 per cent and 3 per cent presumptive minima and in addition was admixed with a certain amount of caustic alkali, possibly derived from some residue of a bottle cleansing fluid.

MILK CONTROL

The following tables indicate the control exercised over milk sold within the city.

Phosphatase	Pastcurised	114	114	100		

Mineral waters

196 samples were procured for bacteriological examination: 4 were found to be unsatisfactory due to the presence of coliform organisms. Each adverse case was investigated by the Food Inspectors and remedial measures taken.

Frozen confectionery

270 samples were examined at the Central Laboratory: 79 of these were found to be unsatisfactory due to the presence of coliform organisms. As all these adverse samples were manufactured outside the city, the Health Authority concerned was asked to investigate the cause.

Bacteriological examination of imported egg powder

Samples taken for examination:—

Frozen eggs	 	 	 	42
Dried eggs	 	 	 	7

No calmonella organisms were isolated in any of the samples.

Pasteurisation of liquid eggs

36 samples of pasteurised liquid eggs were taken from local bakeries and submitted to the Public Analyst for the prescribed Alpha-Amylase Test. One sample did not comply with this test and, as it had been pasteurised outside the city, the Health Authority concerned was notified.

Desiccated coconut

50 samples were taken during the year for bacteriological examination; all produced satisfactory results.

Imported fruits

Several samples of citrus fruits and bananas were examined for the presence of colouring matter and antibiotics. All samples were found to comply with the Colouring Matter in Food Regulations and the Preservatives in Food Regulations.

Merchandise Marks Acts 1887 to 1926

In 19 instances the vendor's attention was drawn to labels on imported foods which did not comply with Orders made under the above Acts. On subsequent inspections it was not found necessary to institute legal proceedings.

The control of food unfit for human consumption

Fire damage in 4 premises (a grocer's wholesale fruit store, licensed premises and a wholesale confectioner's) accounted for a varied selection of foodstuffs destroyed. As will be seen from the follow-tables much of the Food Inspectors' time was taken up examining canned goods and poultry before their release to the retail trade. Out of 37,339 poultry examined, 592 were found to be unfit for human consumption, 585 of these being boiling fowl. During the year there was a marked increase in the number of complaints from members of the public relating to foreign matter in food. All these cases were investigated and in 24 instances legal proceedings were instituted.

Poultry examined during the year:—

Boiling fowl		 	 	 33,251
Roasting fow	1	 	 	 1,705

6,817 certificates were issued during the year in connection with unfit foods surrendered and destroyed.

Unsound food seized and destroyed in pursuance of Magistrates' Orders

I tin of strawberries; 2 bottles of kali water; 2 bottles of lemonade; 1 meat pasty; 1 tin of broad beans; quantity of chocolate; quantity of tea; 5 tins of tomatoes; 1 bottle of coca cola; 2 sausage rolls; 3 bottles of sweetmilk; 2 soda farls; 1 packet of potato crisps; 1 cheese sandwich; 39 fowl; 4 turkeys; 3 packets of slimming biscuits; 5 x 3 lb. bags of oatmeal; 8 x 6 lb. tins of corned beef; 1 packet of kippers; 1 sliced loaf; 1 packet of infant food; 1 packet of broth mixture; 1 packet of Fruesli cereal; 5 packets of cheese; 18 lbs. of cod fillets; 1 chewing-gum cigarette; 1 packet of beef sausages; 1 fruit cake; 3 meat pies; 1 cake; 2 sliced plain loaves; 1 puff pastry; 1 sliced pan loaf; 1 cream sandwich; 3 potato farls; 1 French baton; 2 pastry; 1 layer cake.

Foreign matter in Food

Wasp in tin of strawberries Caustic material in bottle of sweetmilk

*Wire staple in meat pasty

Piece of glass in jar of baby food

Maggots in packet of slimming biscuits *Quantity of soil in tin of broad beans

*Taint of disinfectant in bottle of lemonade (3 instances: 1 prosecution)

Taint of oil in bottle of lemonade (2 instances)

*Chemical in quantity of tea

*Dirt in bottle of kali water *Mould on tinned tomatoes

Portion of plastic material in jar of beetroot

Mould on sausage rolls
Mould on tin of corned beef

*Foreign matter in bottle of sweetmilk

(7 instances: 1 prosecution)
Mould on carton of candy fudge

Mould on soda farls

Mould on "Wimpy"

Beetle in packet of potato crisps

Green fly in salad roll Mould on cheese sandwich

*Insects in packets of slimming biscuits

*Maggots in bags of oatmeal Maggots in packet of kippers Mould on sliced loaf

- *Insect in infant food Mites in packet of broth mixture Maggot in packet of Fruesli cereal
- *Mould on packet of cheese Worms in cod fillets
- *Insect in chewing gum
- *Mould on packet of beef sausages

 Portion of plastic material in bottle of lemonade

Maggots in packet of dates

Piece of cardboard in quantity of potato chips

Insect in tin of fruit (2 instances)

Maggots in quantity of bacon (2 instances)

Piece of rubber in packet of butter

Piece of glass in bottle of sweetmilk (2 instances)

Insect in quantity of minced steak

Portion of hide in tin of stewed steak

Mould on pot of jam

Mould on tin of pork luncheon meat

Piece of rubber in bottle of lemonade

Insects in packet of cereal

Insect in packet of tea

Fibres in barmbrack

Piece of wire in meat pasty

Fibres in tin of peas

Live worm in salad sandwich

Portion of cigarette in quantity of potato chips

Fly in bottle of beer

Piece of cardboard in bottle of sweetmilk

*Portion of cigarette in french baton Insect in pastry

Piece of cord in crusty loaf

- *Mould on layer cake
- *Mould on cream sandwich
- *Mould on three potato farls
- *Portion of cigarette in pastry
- *Piece of hessian in puff pastry
- *Mould on sliced plain loaf
- *Wasp in cake
- Mould on chocolate eclair
- *Portion of cigarette in fruit cake
- *Mould on meat pies
- *Mould on sliced pan loaf.
- * Denotes legal proceedings taken.

ICE-CREAM

Regular sampling of ice-cream continued throughout the year. 71 samples purchased for chemical analysis were all found to comply with the required standards. 905 samples were procured for bacteriological examination. Where unsatisfactory counts were reported, the persons concerned were notified.

FOOD HYGIENE

During 1966 the Food Inspectors made 20,492 inspections of premises in which food is prepared, stored or sold. Where defects were found notices were served requiring work carried out to bring the premises into compliance with the legislation. This action resulted in a large number of improvements to all types of food premises.

Details of plans showing proposed alterations to food premises

80 plans were submitted to the Department during the year to ensure that the premises classified as follows complied with the relevant legislation.

Fruit and vegetables	• •					3

RODENT CONTROL

Rodent infestation generally and rat infestation in particular has declined in severity and it is significant to note that no major infestation was reported during the year. Whilst the means for a spectacular wiping out of the rat and mouse population are not yet available, it can be claimed that satisfactory progress has been made in the reduction of their numbers. A great deal of importance is attached to systematic surveys of lands, buildings and other places where rodents are likely to be found. In this way infestation is detected and remedied before it has time to develop to serious proportions. The surveys continue to reveal that many sites that were subject to recurring infestation are still trouble-free since they were disinfested and rat proofing carried out some years ago.

The Rodent Control staff examined 11,021 sites during the year in connection with systematic survey and investigation of complaints and a further 13,231 visits were made entailing operational work and re-examination of buildings and lands during or following treatment. During the year 651 sites were found to be infested, the majority slightly and details are shown in the statistical table. As part of the investigation to trace the source of these infestations, the drains of some of these sites were investigated by Public Health Inspectors. Drain tests were subsequently applied and defective drains repaired. The importance of the effective scaling of disused drains, especially at the connections to the sewer on sites where buildings are being demolished, must be stressed. Failure to do so results in outbreaks of rats on the site from an underground defect which may be difficult to trace and several rat infestations during the year were found to be due to this omission. It is also essential that drains undergoing construction or repair should be temporarily capped when the work is left incomplete, especially overnight, as a precautionary measure against the escape of rats from drains or sewers.

During the year 335 buildings and lands were disinfested from rats and mice. Occupiers of buildings and lands who desire assistance for the destruction of rats or mice are required to reimburse the Local Authority for the expenditure incurred.

Sewer Treatment

Contrary to popular belief, rats found in sewers are not fundamentally different from the common or brown rat found in buildings in towns or in the countryside. Sewer rats are of the same species, rattus norvegicus, and are known to use the sewers as a means of travel from one site to another through defects in the drainage system. There is, therefore, a definite link between sewer and surface infestations in the built up areas of the city and it is extremely important that rat destruction on the surface and in the sewers is closely co-ordinated in order to maintain a high standard of rodent control in the city. With the main object of reducing rat infestations of buildings that may have their source from sewers, maintenance treatments for the destruction of rats in sewers were continued during the year with satisfactory results with the assistance of the City Surveyor in providing the essential labour. The City Surveyor's co-operation is gratefully acknowledged.

Insect Pests

During the year complaints regarding various insects such as bed-bugs, cockroaches, fleas, flies, spider beetles, steamflies and pharoah's ants were investigated and complaints advised on the best method of dealing with their problems. Treatment in special circumstances was carried out on request from Public Health Inspectors and Health and Welfare Visitors. Rag merchants' premises were given monthly treatments on an agreed basis of payment and Corporation property (dwelling houses) was disinfested of vermin, usually on a change of tenancy at the request of the Estates Superintendent.

Disinfection and disinfestation

The marked reduction in the incidence of infectious disease during the past years has naturally led to fewer demands on the disinfection side of this section. The duties associated with disinfestation continue to more or less the same degree. It may be of interest to list the principal duties for which this section is responsible: investigation of cases of infectious disease; disinfection of infectious premises; disinfestation treatment of verminous premises and persons; disinfection and disinfestation station; delivery and collection of home nursing equipment; transport for Food Inspectors; attendance on volumetric instruments for air pollution; miscellaneous transport services (stores, clinics and schools); drain testing.

Conclusion

I have much pleasure in recording my thanks to the Medical Officer of Health and his Deputy for their help and advice and am most grateful to the Administrative Officer and his clerical staff for the maintenance of excellent records and the production of statistics relating to the work of the Public Health Inspectors. The loyalty and hard work of the Inspectorate and their support given to me is gratefully acknowledged.

W. JENKINS, M.R.S.H., M.A.P.H.I.,

Chief Public Health Inspector.

REPORT OF THE CITY VETERINARIAN FOR THE YEAR 1966

Total Slaughter

The total number of animals (265,602) slaughtered at the Belfast Abattoir in 1966 showed an increase of 13,533 compared with 1965. Cattle showed an increase of 3,554; sheep and lambs an increase of 13,418; pigs a decrease of 1,425 and goats a decrease of 1,014.

Number and description of animals slaughtered each month

TABLE C 1

Total Cattle			62,674	1				

Grand Total 265,602

Carcase condemnation

The number of carcases totally condemned in 1966 was 700, compared with 498 in 1965, an increase of 202. Total condemnations represented 0.26% of the total slaughter. 597 sheep carcases were seized, representing 0.30% of the total sheep kill, and 54 pig carcases, representing 1.60% of the total pig kill.

Total seizure from all causes

TABLE C 2

Class	1966	1965	Percentage of total kill
Cattle	42	101	0.07
Sheep & Lambs	597	290	0.30
Pigs	54	82	1.60
Goats	7	25	3.43
Totals	700	498	0.26

As far as individual disease conditions are concerned the greatest losses were due to generalised oedema, decomposition, bruising, abscesses, pneumonia, pyaemia and peritonitis. The majority of generalised oedema and decomposition cases occurred in sheep, while pyaemia was most common in pigs, associated with various injuries such as tail biting, castration wounds and hypodermic injections. Total and partial seizure of carcase meat in all species amounted to 69,028 lbs. Condemned offal and trimmings amounted to 915,697 lbs.

TABLE C 4

Month	Cases detected	Total slaughter (Cattle)	Percentage incidence
January	410	5,672	7.23
February	201	4,733	4.25
March	368	5,869	6.27
April	191	4,279	4.46
May	356	4,551	7.82
June	292	4,878	5.99
July	472	4,473	10.55
August	276	5,362	5.15
September	548	5,399	10.15
October	299	6,107	4.9
November	467	6,298	7.41
December	362	5,053	7.16
Totals	4,242	62,674	6.77%

The percentage incidence of 6.77 represents an increase of 0.91% compared with 1965. This is the highest incidence ever recorded at Belfast Abattoir.

Since financial losses to the meat trade result from this condition a compensation scheme (based on a levy payable by the Trade and supported by Government Funds) was commenced by the Ministry of Agriculture in October, 1966. This has served to alleviate these losses but does not fully meet them. While efficient meat inspection can serve to prevent carcases infested with C. bovis reaching the consumer, it is considered essential that attention be given to the control of this menace at earlier stages, e.g., in the provision of adequate sewage purification systems and the prevention of access of cattle to pasture treated with sludge. The Government Interdepartmental Committee's report on this condition is expected shortly.

Assistant City Veterinarian

Approval having been given by the Health Committee and Council to the post of an Assistant City Veterinarian, it was hoped to appoint an officer during February, 1967.

Laboratory Examination of Meat and Meat Products

With the virtual disappearance of conditions such as bovine tuberculosis and other readily diagnosable diseases, we have seen the ingress of conditions such as salmonellosis and others which cannot easily be detected by visual means. Included in the latter are residues of antibiotics, heavy metals, hormones, pesticides, etc., the presence of which can only be confirmed or even detected by laboratory examination. A laboratory has been provided in the Municipal Abattoir and, once technical staff have been appointed, the meat inspection service will be fully geared to provide, in ante—and post—mortem examinations as well as in those cases demanding it, a full laboratory examination. Another aspect of meat inspection not hitherto utilised—its participation in the control of animal dieseases—has commenced with the notification, to producers supplying livestock under the Fatstock Guarantee Scheme, of details of the percentage of fascioliasis encountered in their animals at slaughter.

Transport of Meat

Part VI of the Food Hygiene (General) Regulations (N. Ireland) 1964 required improvements in meat transport standards. While these have undoubtedly been raised, there still remains room for improvement, not only in relation to vehicle construction but also methods of handling. Since the new City of Belfast Meat Plant will provide a chilled meat product it will be necessary to continue the "cold chain" by using low temperature transport, even for short retail delivery.

First Aid Facilities

The provision of a First Aid Room in the Municipal Abattoir has proved a great success and is greatly appreciated by the staff. While most of its work is concerned with minor cuts and bruises, on occasions more serious injuries have occurred. The large number of treatments carried out and the fact that serious forms of illness can occur would appear to justify legislation for the provision of a First Aid Room and a full-time qualified attendant, at least in the larger abattoirs.

Occupational Hazards in the Meat Industry

Most of the conditions in staff transmissible from animals take the form of bovine ringworm and contagious pustular dermatitis and these occur infrequently, mostly during the winter months. They emphasise the need for care in the handling of livestock and a high standard of personal hygiene. An investigation in collaboration with the Department of Microbiology, Queen's University, has revealed the occurrence of positive agglutinin reactions to Coxiella burneti in some meat operatives. This organism, originally termed Rickettsia burneti, is responsible for Q Fever in human beings and occurs as a normal commensal in sheep.

Total	10,914

Infant Mortality

During the year, 264 children died under the age of 12 months giving an infant mortality rate of 32. The rate for the previous year was 27.

Neonatal and Perinatal Mortality

Deaths occurring during the first month of life numbered 155 giving a neonatal mortality rate for the year of 19. The rate for the previous year was 18. The perinatal rate, i.e., stillbirths and deaths during the first week per 1,000 total births (live and still), was 34 against 33 for the previous year.

Maternal Mortality

For the first time on record there were no deaths attributable to pregnancy, childbirth and the puerperal state. In 1965 there were 2 maternal deaths giving a rate of 0.24 per thousand total births.

Health Visiting

60 health visitors were employed at the end of the year. The main part of their work continues to be the visitation and supervision of the health of infants and young children, special attention being given to those infants considered to be in the "at risk" category. A considerable amount of time is devoted to other duties, such as the after-care of patients discharged from hospital, supervision of special diets and the use of medical equipment. A greater amount of their time is now devoted to the well-being of the increasing numbers of old people in the community.

The visitation of tuberculosis and chest cases is undertaken in co-operation with the Central Chest Clinic, a few of the health visitors being allocated specially to this work. A number with special training in mental illness devote part of their time to the after-care of mental cases. They visit the mental hospitals and work with the Psychiatrists and Psychiatric Social Workers. Others attend sessions at the mental day hospitals.

One health visitor is attached to a group practice and undertakes all the health visiting duties connected with the practice. The number carrying out liaison duties with general practitioners continues to grow and the contacts thus formed are most helpful in resolving many varied problems. With the increase in the number of group practices in the city more general practitioners are seeking the services of the health visitors. The long established health visitor/hospital liaison also continues. Two health visitors devote a proportion of their time to diabetic cases. They attend the hospital metabolic unit and visit the patients in their homes.

The Health Visitors assist the Welfare Department in the administration of the Home Help Scheme as far as expectant mothers and mothers of young children are concerned, and close contact is maintained with that Department on various aspects of district work. A large part of the Health Visitor's time is spent on domiciliary health education work and on group teaching. Subjects such as mothercraft, prevention of home accidents, nutrition, food hygiene, care of the aged at home, care of the feet, dental care, etc., are taught in the course of normal visitation or to selected groups. A number had the opportunity of attending refresher courses and conferences, and all continued to assist in research projects.

Visits paid during the year were as follows:—

- (1) To expectant mothers: first visits, 2,215; Re-visits, 2,728; Total 4,943.
- (2) To children under one year of age: First visits, 8,047; Re-visits, 48,128; Total 56,17 5
- (3) To children between 1 and 5 years: 75,182.
- (4) To tuberculosis cases, 5,941.

Ante-Natal Clinics

As the great majority of expectant mothers attending the ante-natal clinics make arrangements through the clinics for their confinement in hospital, the Clinic Medical Officer maintains close contact with the hospitals. At the Royal Maternity Hospital she also assists at one of the ante-natal sessions and is a member of the honorary medical staff. Speciments of blood are taken for group, Rh factor, Wasserman, etc., and arrangements are in operation whereby private medical practitioners can refer their cases to the clinics for these tests. Some medical practitioners also refer abnormal cases for a second opinion. Instruction in analgesia and in relaxation has been continued in combination with a special series of mothercraft talks. These are open to all ante-natal cases irrespective of whether they are attending for ante-natal supervision or not.

Totals	313	2,274

2,088 blood tests were carried out during the year.

Child Health Centres

The number of sessions provided at the end of the year increased to 40 per week — only 17, however, were in buildings owned by the Health Authority; I was held in the Ormeau Road Health Centre the other 22 in halls, etc., rented on a sessional basis. As there is no alternative accommodation available in some areas a number of sessions continue to be held in very unsuitable premises.

The educational aspect of the work was kept well to the fore and special stress was again placed on the prevention of accidents. The members of the Voluntary Workers' Association continued their help in the weighing of the babies and arranging social functions for the mothers, and our thanks are again due to them for this valuable assistance in our work.

Number of cases in which medical aid was summoned by a midwife during the year under Section 34 of the Nurses and Midwives Act, (Northern Ireland), 1959: Nil

Domiciliary Midwives

23 midwives were employed on a salaried and 3 on a fee-per-case basis. Progress continues to be slow in recruiting sufficient midwives to enable the service to be placed entirely on a whole-time salaried basis. Two hostels are in operation, one in Springfield Road and the other in Templemore Avenue. Both hostels provide for a number of resident pupil midwives. A self contained flat is incorporated in the Child Health Clinic at Ballymurphy for 2 midwives. The Health Committee also contributes a proportion of the expenditure on the training of pupil midwives in conjunction with the Belfast City and Royal Maternity Hospitals.

Allowances to cover uniform, laundry and travelling are granted, the uniform being that laid down by the Joint Nursing and Midwives Council. Equipment is issued on loan, and all drugs, dressings, etc., in use are supplied to the midwives. Special cots, etc., for the care of premature babies are available. The trend however is for these babies to be admitted to the special nurseries attached to the two large maternity hospitals in the City. Refresher courses are arranged from time to time.

The midwives attended a total of 1,207 domiciliary cases during the year.

Number of midwives suspended from practice during the year in order to prevent the spread of infection—Nil.

Maternity Medical Services

General Medical Practitioners agreeing to provide maternity medical services in domiciliary cases are enrolled on a panel maintained in the department and are paid on a fee-per-case basis. Both the doctor and the midwife are paid by the Health Committee.

The following is a summary of the work carried out under the scheme by Medical Practitioners during the year:—

Home Nursing Service

The Home Nursing Staff consists of 1 Superintendent, 1 Assistant Superintendent, 54 Queen's Nurses, 2 State Registered Nurses and 2 State Enrolled Nurses. There were 18 nurses in training during the year: 9 were Departmental candidates and 9 were county candidates. The training remains at a high standard and several of the candidates obtained credits in various subjects at the examination.

The total number of visits paid was 241,490 compared with 243,547 in 1965.

Sick room requisites such as Dunlopillo mattresses, air cushions, bed-rests, rubber sheeting, bed-pans, incontinent pads, etc., are sent out to patients on loan when required through the medical comforts depot. The use of sterile packs for the nurses' bags has proved very beneficial. The Marie Curie Fund was utilised for obtaining extra facilities for cancer patients—bedding, clothing, extra nourishment, night sitters, etc.

Cervical Cytology

A number of cytology sessions were arranged weekly at three health centres during the year. In addition to taking the cervical smear for the early detection of cancer, further examinations are carried out with a view to the detection of other abnormalities and the clinic tends to be more of the "well woman" type. The women are instructed in the self-examination of the breasts for the early detection of cancer. In all cases a report is sent from the clinic to the patient's own doctor.

Women examined	 	 	 1,589
Positive cervical smears	 	 	 3
Abnormalities found	 	 	 862

After-Care

The Committee's scheme for help in the provision of special diets for a period of up to six weeks in certain cases was in operation throughout the year, and a total of 1,791 cases received assistance. In addition 833 tuberculosis patients received one pint of milk daily on the recommendation of the chest physicians. During the year 1,680 new issues of medical comforts were made and 1,361 persons returned loaned equipment. The number holding equipment at the end of the year was 1,473.

Chiropody

This scheme provides for the treatment of the aged, handicapped persons and expectant and nursing mothers. At the end of the year 81 sessions were being held weekly, attended by 4 full-time and 5 part-time chiropodists. During the year 7,467 persons received treatment; and the total number of treatments carried out was 19,087, 14,806 at clinics and 4,281 at patients' homes. Unfortunately, owing to the shortage of chiropodists, there was a considerable number of applicants on the waiting list at the end of the year. The Health Committee also gives financial assistance to a scheme organised by the Belfast Council of Social Welfare.

In conclusion I would like to express to the members of the staff my sincere appreciation of the

excellent manner in which they discharged their duties throughout the year.

H. A. WARNOCK, M.D., B.Sc., D.P.H.,

Senior Medical Officer

Maternity and Child Health Division.

REPORT OF THE SENIOR MEDICAL OFFICER, SCHOOL HEALTH DIVISION, FOR THE YEAR 1966

Belfast Grant-Aided Schools

The School Health Service has the duty to carry out medical inspection and treatment of all pupils attending grant-aided schools: the relevant legislation is found in Section 42 of the Education Act (N.I.) 1948, as amended by the Education (Amendment) Act (N.I.) 1956. Table E1 shows the various types of grant-aided schools in the City of Belfast at 31st December, 1966 and the number of pupils attending them. At the end of the year the grant-aided school population was 80,982, an increase of 252 compared with 1965. Not included in the table are five small independent schools with a total enrolment of 280 pupils: these schools do not take part in the various activities of the School Health Service and the pupils do not have systematic medical inspections. Three voluntary secondary schools, all with junior departments, conduct their own schemes of medical and dental inspection and treatment in accordance with Section 42 (6) of the Education (Amendment) Act (N.I.) 1956.

During the year two new nursery classes were opened in primary schools, raising the number of nursery schools and classes to twelve. Two old county primary schools were closed and a new one was opened, reducing the number of county primary schools to 64. Three voluntary primary schools were closed and two new ones opened; a girls' voluntary primary school was amalgamated with a nearby boys' school; these changes reduced the number of voluntary primary schools to 58. The nursery school for the physically handicapped was combined with the main school, reducing the number of special schools to 9.

Staff

At the beginning of the Christmas term the long-standing shortage of medical officers was relieved by the appointment of a full-time doctor and an increased number of sessions from a part-time doctor. The Northern Ireland Hospitals Authority continued to second a number of ophthalmic specialists, a paediatrician, a surgeon and a psychiatrist; the number of ophthalmic sessions has been inadequate for some years and the waiting-list remains unduly long, but the Authority is making efforts to recruit more ophthalmic specialists. Several suitably qualified nurses were seconded to the Health Visitor's Training Course of the Royal College of Nursing which began in September and a number of nurses returned to duty as health visitors in July, having completed the previous course. Two additional nurses were appointed towards the end of the year to deal with hygiene inspections and other routine work not needing the health visitor's specialised training.

The speech therapy staff consisted of one full-time and five part-time therapists for most of the year. The shortage of therapists continues and we found no suitable candidates for secondment to the training courses held at various centres in Great Britain. There were several inquiries from girls about to leave school, but none had the necessary educational qualifications. The Health Committee makes grants equivalent to a Major Award Scholarship which covers tuition fees, examination fees, books, maintenance and travelling expenses: the course lasts for three years and the trainee contracts to work for at least two years after qualification as a speech therapist employed by the Health Committee. The Youth Employment Service has also tried to find candidates for training, but without success. There were several changes in the staff of physiotherapists and occupational therapists which remained one or two short throughtout 1966. A number of these therapists are employed by the Northern Ireland Council for Orthopaedic Development and seconded to work in the School Health Service.

For many years there has been a shortage of specialist staff of all kinds to deal with the various handicapped children at school. Not only is there a shortage of therapists and other medical staff, but educational psychologists, teachers-of-the-deaf and psychiatric social workers cannot be obtained. Housemothers are now more easily found and the Rupert Stanley College of Further Education again held its annual Child Care Course to train them. Suitable students may return to the College for a second year to take the Advanced Child Care Course. Housemothers continue to do excellent work in our special schools, making it possible to deal with very heavily handicapped children who would otherwise have to remain at home.

School Medical Inspections

The School Health Service (Amendment) Regulations (N.I.), 1963, authorised the supervision of schoolchildren's health by new methods, and in 1964 and 1965 we made trials at 4 schools of selective as opposed to routine medical inspections. Throughout 1966 a trial took place of the selective method applied to all except nursery and special schools. Entrants as usual were given a thorough routine

examination by the medical officer and health visitor which included audiometry and tests of visual acuity and colour vision; immunisations were checked and arrangements made to bring them up to date. Efforts were made to encourage parents to be present at the examination and absentees were followed up by the health visitor; the views of school principals and class teachers were taken into account and both a history sheet completed by the parent and the maternity and child health records were available to examining doctors and nurses. As shown in Table E2 the number of entrants examined as part of the selective procedure totalled 7,484.

A number of schools where medical inspections had commenced in 1965 were completed on the old system in January, 1966 and this involved 748 routine medical examinations at primary schools and 687 at secondary; 405 children at nursery and 458 at special schools also received routine examination (see Table E2). With these exceptions no other children were fully examined as a routine. Children of school-leaving age, Group IV, were fully examined if a study of their records showed this to be necessary; otherwise they were interviewed to discuss their health with special reference to future careers. At these interviews disabilities might be revealed for which a partial or occasionally a full examination was needed. The visual acuity and colour vision of all leavers was tested and a further offer of B.C.G. vaccination was made to defaulters from previous years. Interviews totalled 3,060 and examinations 1,234.

At all ages other than entrants and leavers examinations were made only where this appeared to be necessary on information received from teachers, parents, health visitors, or others. Children for whom no medical records were held were given a full medical examination; these children were usually newcomers to the district or occasionally absentees from previous years or late entrants to school. The 870 children examined in this way are shown in Table E2 under Age Groups II, III, and V, selective.

Annual re-examination by the medical officers of all defects found on previous occasions continued concurrently as part of the selective scheme. Children are added to the re-examination list not only on being found to have defects at school medical inspections, but on the finding of defects at anytime at the clinic or elsewhere, or on information from hospitals or doctors; they remain on the list until they are cured or leave school, so that at least an annual review of all defects should take place, followed by appropriate remedial action. In 1966 the list of those whom we succeeded in re-examining had 24,128 defects in 19,147 children. Table E12 shows further details of these. The re-examination list thus includes at any time about a quarter of the school population.

This extensive trial of the selective procedure was carried out for comparison with the routine methods that have obtained since the beginning of the century. The new system proved satisfactory for entrants and fairly satisfactory for leavers. Some leavers themselves were critical of the interview and remarks such as "he never even looked at me" were sometimes made to the health visitor after an interview involving full discussion of past and present health, tests of visual acuity and colour vision and consideration of the pupil's physical fitness for his chosen career. Some medical officers found it difficult to establish the right atmosphere for an interview without some form of physical examination and it was often difficult to explain why some leavers were examined and others not. Those examined sometimes feared the worst, while those interviewed felt neglected. However, the same procedure for entrants and leavers will continue during 1967, with full examination of all entrants and about one third of the leavers and interview for the remaining two thirds of the leavers.

There was no difficulty in examining fully those children of other ages who were brought forward by teachers and others, but our medical staff felt that the ten year olds (Group III) should again have routine examination and this will be resumed in 1967. This group under the selective scheme needs to be given tuberculin tests and B.C.G. vaccination and to have vision tests and audiometry by the health visitors. This means three separate approaches to the children, apart from the selection of a few hundred for full examination; there is consequently much greater disturbance to the school and more administrative work for the medical staff than under the routine method. The selective system in general is more time-consuming and more difficult to organise. Under the selective procedure it is still necessary to test vision and hearing at intervals. In 1966 the health visitors did vision screening tests and audiometric sweep tests on children in classes PIV and PVI to cover the gap between entrants and leavers examinations; 7,494 vision tests and 10.852 hearing tests were done. Slight abnormalities were kept under observation, while more serious cases received specialist attention.

Table E3 shows the numbers of parents who attended school medical inspections; 45.2% is rather higher than in previous years, and as usual the great majority of these attended with entrants.

Table E4 shows a summary of the action found to be necessary by the school doctors as a result of school medical inspections; as usual considerable numbers of apparently healthy children were found in need of attention not already being provided.

At medical inspections the parents of each child are asked to complete a questionnaire. Among other questions the parents are asked to indicate which of the commoner infectious diseases the child has had. Table E5 shows the numbers and percentages in the various age groups who gave a history of having had these diseases.

Defects discovered at Medical Inspections

Table E7 shows the defects discovered at medical inspections under the selective procedure. The defects are grouped according to the body-system classification used on the standard national school medical inspection record; this does not include the digestive or genito-urinary systems and defects of these are entered under the final group as "other defects." The rates per thousand children examined are not comparable with those in previous years and are in general higher since a great proportion of the children were selected for examination because of known or suspected defects. The rates per thousand leavers interviewed, on the contrary, are generally lower than the rates for entrants and other ages since those interviewed were selected as being unlikely to have defects.

Colour vision was tested in entrants this year rather than in leavers on the grounds that the presence of a colour vision defect should be known to teachers who might modify their handling of the child's problems accordingly. In about one out of seven entrants it proved very difficult to be sure of the results of the tests and these children have been listed for retesting later; the high figure of 1,044 entrants for observation owing to "other eye defects" is accounted for in this way. It has been decided in future to test colour vision at age 10 years. The results of colour vision testing are shown in Table E10.

Table E8 (a) and(b) show the results of tests of visual acuity at medical inspections with the defects for each eye distributed according to their severity. Part (a) of the table shows tests in 12,510 children without glasses and part (b) shows tests repeated in the 933 children who had glasses. It was not possible to test accurately the vision of 138 entrants and these are omitted from the table.

Table E9 shows the doctor's assessment of the nutritional state of the children at medical inspections; as usual there were very few badly nourished children.

Heights and Weights

. Table E6 shows data relating to the heights and weights of children examined under the selective scheme. For height and weight at each year of age are given the mean with its standard error, the standard deviation, and the co-efficient of variation.

Tuberculin Tests and B.C.G. Vaccinations

Table E11 shows the results of tuberculin tests in 3,940 unvaccinated persons of all ages, 9.2% of whom were found to be tuberculin positive and of 1,805 previously vaccinated persons, 95.8% of whom were positive. The rate of 9.2% positive in unvaccinated persons is the lowest yet recorded for the young in Belfast since routine tuberculin testing started in 1953, the previous lowest rate being 11.4% in 1965 and 1964. However, this year's table includes a number of infants and young children, most of whom would be expected to be negative and the selective method of reaching many of the children makes the table hardly comparable with those of previous years. Attempts were made to test children at about ten years of age, but this was more difficult than usual because the children could not be dealt with at the ten-year-old medical inspection as in the past. Attempts were also made to test those leavers who had defaulted in the past. During 1966 our doctors vaccinated 3,100 children with B.C.G. Returns are made to us of Belfast residents of any age given B.C.G. vaccination by other authorities; these amounted to 3,059 for the year.

Handicapped Pupils

Section 30 of the Education Act (N.I.) 1947, as amended by the Education (Amendment) Act (N.I.) 1956, directs that all handicapped children over the age of two years shall be found and given suitable special educational treatment: the Handicapped Pupils and Special Schools Regulations (N.I.), 1957 define ten categories of educational handicap.

Table E14 shows the numbers of educational handicaps affecting Belfast boys and girls at 31st December, 1966. Tables E15 to E20 relate to a count on the same date, but the list is a constantly changing one, with additions and deletions almost daily owing to the arrival of newly handicapped children and the discharge of others cured or over school age. There is a tendency for the numbers to

increase, partly owing to more complete ascertainment and partly because improved treatment keeps more damaged children alive. Ten years ago, for example, of children born with the spinal abnormality spina bifida, only one in ten survived early childhood; now seven out of ten can survive to school age at least and many of these are severely disabled with leg paralyses and bowel and bladder incontinence. Many children have several handicaps, each of which if it existed alone would necessitate special educational treatment and so it is necessary to reckon in terms of handicaps as well as of children; thus Table E14 shows that 5,290 handicaps were distributed among 4,600 children and indicates the type of schools where the problems are being dealt with. Table E15 shows the numbers of children having one handicap and Tables E16 and E17 show how the multiple handicaps were combined.

Table E19 shows the main defects affecting the children at Fleming Fulton School; these are serious and permanent handicaps which make it necessary for the children to spend the greater part of their school career in the special school where medical treatment and special education are combined. The main work of rebuilding Fleming Fulton School was completed during the year, but the school had already outgrown its accommodation before it was finished and the addition of two more classrooms was commenced; these classrooms were nearly finished by the end of the year. During the Summer Malcolm Sinclair House ceased to be a separate school and moved into the new nursery wing built as part of Fleming Fulton School. The school deals with physically handicapped pupils from the whole of Northern Ireland and at the end of 1966 there were 50 pupils from outside Belfast.

At Cedar Lodge School the children are classed as delicate with disabilities less severe and often temporary. The average duration of stay at this school is about three years, after which normal schooling may be resumed. Table E20 shows the defects of the 54 children admitted during 1966.

The child guidance clinic at Fortwilliam which was completed in 1965 was worked at the rate of two sessions per week at the rate of two sessions per week this year. Shortage of child psychiatrists made it impossible for the Hospitals Authority to provide more sessions. Sixteen new cases were taken on by the psychiatrist and in all 93 attendances were made in 1966. The premises were in daily use throughout the year by the school psychological service and by the remedial teachers.

School Clinics

The new school clinics at Cupar Street and Lincoln Avenue have continued to be busy. The older clinics at Academy Street and Cherryville Street are also to be replaced, and a site for the former has not yet been found. These clinics form the base from which the varied activities of the School Health Service are carried out. The doctors, health visitors, therapists and other workers are attached to one or another of the four school clinics, each of which deals with a quarter of the city having about 50 schools and about 20,000 schoolchildren. The medical and dental records of these children are kept at the clinics and it is here that many types of treatment and investigation are done. The premises are also used by the school psychologists and by social workers of the Welfare Authority who hold sessions for the adult handicapped. A group of parents of deaf children meets monthly in the evening at Cupar Street Clinic when a teacher-of-the-deaf, the senior health visitor and others help with their problems.

Many of the problems dealt with at a school clinic are of a psychological nature and require the combined efforts of the doctor and the psychologist; often these problems have their origin in the school, where the relief of stressful situations may be needed. Remedial teachers work with individual children or small groups in the clinics to assist them to make up ground lost through illness or other eventualities. A number of alarm buzzers are in use for the treatment of enuresis; these are lent to the home for a few weeks with careful supervision by the medical and psychological staff and have often proved effective in helping to control bedwetting.

Infestation with the head louse continues to be a troublesome problem in schoolchildren, about one in twenty of whom is still infested in this city. Heads are examined at intervals in schools and infested children are cleansed to the satisfaction of the health visitor before being allowed to return to school; the parents are advised how to cleanse, fine comb, and maintain their children's hair and cleansing is also done at the school clinics which are equipped and staffed for this. Unfortunately re-infestation occurs almost at once in the home from older relatives. The amount of infestation has decreased only slowly in the past fifteen years and remains one of our most intractable problems.

Health Education

Lectures, films, demonstrations, courses and conferences are held in clinics and schools and all medical students, student nurses, student health visitors and student district nurses are shown the

working of the clinics and receive lectures on the local authority's health services. The halth educatione programme includes the use of posters and pamphlets, and film shows or talks by health visitors, doctors and dentists are given to parents' associations.

In 1966 a trial commenced of dealing with health education of schoolchildren in a more systematic way. Several health visitors devised child-care courses which were given to girls at secondary schools. The courses have taken various forms but usually one or two school periods per week have been given by the schools for up to about 20 weeks. The health visitor demonstrates such matters as bathing, clothing and feeding a young baby using suitable plastic dolls and all the necessary equipment. The children do these things for themselves and are given every encouragement to talk about and question what is being done, so that they really teach themselves under the health visitor's guidance and the formal atmosphere of a lecture is avoided. From care of the baby it is easy to progress to personal hygiene at all ages, with discussion about the desirability of cleanliness, about suitable clothing, diets and sleep and the use of leisure. In the other direction, the birth of the baby comes naturally into the picture and thence to pregnancy and conception, with the problems of interpersonal relationships, boy friends, courtship and marriage freely discussed. These courses have been welcomed by those school principals to whom we have been able to offer them and by parents, but the response of the girls themselves has been so favourable that we have been pleasantly surprised. At the end of a session, the class invariably wants to know when the health visitor will be back and sometimes the discussion continues out to her car, with an excess of willing helpers carrying and packing the equipment. One of the schools included a session with the health visitor as part of their open day, when many parents and other visitors were able to see what takes place.

We had feared that some might not approve of parts of what we include in these courses, but we have had nothing but favourable comment. Some parents and teachers have, in their own words, had their eyes opened and no less have we. The keenness of the girls to have facts rather than rumour about conception, pregnancy, childbirth and the care of children has become abundantly clear. It is equally clear that the girls have in the past not known where to get the facts and that many of them were almost completely ignorant on all matters relating to sex, while others held most wildly-misinformed views and superstitions. Once started on these child-care courses, the health visitor soon found it possible to establish an atmosphere of confidence in which anything could be discussed with the children without embarrassment on either side, though each had to learn the other's terminology. The pupils themselves introduced the topics of violence, venereal disease, illegitimacy and the illtreatment of children by their parents. They were keen to know about inheritance and why some families tend to be tall and some short, why brothers and sisters may be alike in some respects and not in others such as hair and eye colour, why children tend to resemble their parents and why some babies are born deformed. In these circumstances it is easy to guide the discussion towards the advantages of a secure and stable family life as the basis for happy and civilised living. Though this is interesting and stimulating work it is very time-consuming, not only in conducting the courses in schools, but in preparation and planning. Various firms have been most generous in giving foodstuffs, clothing and other materials for demonstration purposes. Additional schools have asked for courses to be held and those schools already receiving courses have asked for more. We shall extend this activity as circumstances allow and in 1967 it is intended to hold a course for boys.

The pregnant schoolgirl presents problems for which no ideal solution exists; one of these is the difficulty of continuing her education during the pregnancy and after, for whether she keeps her baby or not she will be poorly equipped to maintain herself. Home tuition with help from the school in the matter of books and similar material is the best that can be managed as a rule, though recently one girl remained at school until near the end of her sixth month of pregnancy, while another continued her education at a convent school. There are fortunately only a few schoolgirl pregnancies each year in the city, but these cause a great deal of misery for the parents, for the girls themselves and not least for their babies; there is at least a possibility that health education might help prevent some of these tragedies.

REPORT OF THE CHIEF DENTAL OFFICER FOR THE YEAR 1966

Dental Inspection in Schools

The pupils of all primary and secondary schools within the area of the Belfast County Borough were provided with one dental inspection during the course of the year and additionally, twice yearly-dental inspection was provided for pupils of nursery and special schools. The total number of children examined was 73,511 (or 93% of the total roll) and 36,771 (50%) were found to be dentally defective. Thus, compared with the years 1964 and 1965, when the defective rates were 57.5% and 56.5% respectively, a further significant fall in the defective rate has to be recorded. Consent to dental care was given by the parents of 33,885 children, that is, 92.2% of those in need of care, of which total 9,722 (28.7%) elected to attend at the department's clinics and 24,163 (71.3%) preferred to make their own private arrangements. These figures show a 1% increase over the previous year in those electing to attend at school clinics.

Attendances at Clinics

In addition to the 9,722 children attending clinics as a result of school dental inspection, a further 438 children sought care without notification, making an total of 10, 160 children who received attention. Compared with the previous year, this figure is a reduction of 5.5%, which may well be accounted for by the fall in the defective rate. Periodic check inspections totalling 9,093 were provided at clinics during the year.

Treatment

The department was able to meet all requests for treatment and the filling rate at 2.3 and the extraction rate at 0.7 per child remained as in the previous year. In the orthodontic section, 339 children were provided with appliances and treatment was completed for 120 children. These figures show marginal increases over the year 1965.

The orthodontic service, now in its fifth year, has encountered serious difficulties in the retention and acquisition of qualified staff. At the peak of its existence some two years ago, the department had asorthodontic staff two of its own Dental Officers qualified as orthodontists, one part-time orthodontist and a further two Dental Officers who had attended an extended post-graduate course in orthodontics at the School of Dentistry. The first two Dental Officers have since resigned and after considerable difficulty it was only found possible to recruit one further part-time recently qualified orthodontist with limited availability. It would have been possible for the department, with this reduced staff (equal to little more than half its original strength) to continue to function in a modest way, but unfortunately a more serious set back has occurred in the resignation of the original part-time orthodontist. So much of the department's activities depended on the experience of this officer that it is difficult to see how the orthodontic service can any longer function as an effective unit.

The basic reason for the difficulties encountered lies in the absence of any recognised scale of salaries and fees for orthodontists, and while at the outset in 1961 it was realised that the lack of a suitable salary structure might create difficulties, it was felt reasonable to proceed with the organisation of the service in the hope that an adequate salary structure would materialise. Five years have now elapsed and this has not happened. An orthodontic service is not a luxury service — as the lay mind might be inclined to think. It is an essential part of children's dentistry and contributes substantially to the dental health and well-being of children. Mal-positioned teeth may have an adverse effect upon children in many ways, not the least being that they constitute a serious factor in tooth decay and, at a time when so much effort is being expended in dental health education, it is difficult to understand why delay in the creation of a salary structure for orthodontists should continue.

Maternity and Child Health

In this section, the department continues to be involved with the pre-school child alone and it will be recalled that the annual report for the year 1965 forecast a more encouraging trend in 1966: this in fact has materialised. The number of pre-school children examined has risen from 525 in 1965 to 1.093 in 1966, an increase of 108%. Examination disclosed that 55% of these children were dentally defective and 95% of the latter attended at school clinics with their parents and received advice and care. This is an increase of 44% over the 1965 totals.

It is current practice for mothers to attend the clinic with their young children to receive detailed advice on all aspects of diet and oral hygiene. Regular three-monthly visits for check examination are encouraged and, while the department has had some success in this practice, 366 check examinations fall considerably short of what should be expected. However, one cannot hope to achieve perfection at this early stage of the scheme's existence; rather must it be hoped that the practices advised will in time become acceptable.

General Remarks

The aspect of this annual report which has given most pleasure to its author is the encouraging trend shown in the care of the pre-school child. Admittedly the number of children examined is only a fraction of the total available, but the absence of clinics in the outer residential areas of the city militates against substantial expansion of the pre-school dental service. However, the fact of a 55% defective rate in this category of child points to the necessity for such a service and for the strongest possible action to use all available resources to further the aims of this service.

A house is only as good as its foundations. There is surely an analogy in the dental sphere, in that the permanent dentition is only as good as the deciduous dentition. The foundations for a sound deciduous dentition are laid down prior to the birth of the child and afterwards during the first two years of life. It is vital therefore that the mother should be aware of and should apply knowledge previously imparted to her in regard to diet and oral hygiene. If this is not done, the decidious dentition may not survive to play its part in the establishment of the permanent dentition. The child already brought up on incorrect dietary habits and lack of effective oral hygiene cannot suddenly be induced to accept the wholesale change necessary for good dental health. The dental staff at the department's clinics are playing their part in persuading mothers to use the pre-school child service but the greatest contribution must come from Health Visitors and nursing staff at Maternity and Child Health Clinics. In this respect Lincoln Avenue and Mountcollyer Street Clinics have provided an excellent example of such team work, making a substantial contribution to this year's welcome results.

Once again may I in conclusion express my appreciation to Principals, Teachers, Medical, Dental and Administrative Staff for the high degree of co-operation extended to me during the year.

S. R. SHEANE, L.D.S.,

Chief Dental Officer.
